Wetterübersicht Sonntag, den 21. Juni 1953

Die gestern noch auf dem Atlantik herrschende Zonalströmung ist in den letzten 24 Stunden wieder erheblich gestört worden. Und zwar wurde diese Störung verursacht durch den kräftigen Kaltluftvorstoß, der auf der Rückseite des von Labrador rasch weiter nach Osten gewanderten Tiefdruckgebietes erfolgte. Über dem südlichen Labrador und über Neufundland ging die troposphärische Mitteltemperatur um mehr als 12 Grad zurück. Mit Annäherung dieser Kaltluft an den auf der Westflanke des atlantischen Subtropenhochs nach Nordosten fließenden Warmluftstrom kam es über dem Westatlantik zu einer erheblichen Verschärfung der Temperaturgegensätze. Das von Westen heranziehende Tief gewann infolgedessen weiter an Energie. Die auf seiner Vorderseite sich laufend verstärkende Warmluftadvktion führte zu hochreichender Erwärmung über dem Mittel- und Nordatlantik. Das südlich von Island liegende Zentraltief begann sich daraufhin kräftig aufzufüllen. Auf seiner Südseite wanderte die gestern auf dem Mittelatlantik in Entwicklung begriffene Wellenstörung zunächst nach Osten, um jetzt über Irland hinweg nach Nordnordosten einzuschwenken.

Über Mitteleuropa, das bei geringen Druckänderungen weiterhin im Bereiche einer schwachen Südwestströmung blieb, hielt in den unteren Schichten die allmähliche Erwärmung an. Die nach Nordosten abgewanderte Hochzelle gliederte sich an das von der Barents-See bis zum Baltikum ausgeweitete Hochdruckgebiet an.

Jacobi

Voraussichtliche Wetterentwicklung:

Die vor Irland angelangte Teilstörung wandert nach Nordosten. Ihre Kaltfront überquert morgen Frankreich und dringt im Laufe des Tages in Deutschland ein. Nachfolgender Druckanstieg stellt mindestens vorübergehend die Schönwetterlage wieder her.

Dr. Dülling
