# Inhalt

Seite

*Einleitung* ..... III

*Erläuterungen zu den Tabellen* ..... III

*Verzeichnis der Klimastationen* ..... VII

*Verzeichnis der Niederschlagsstationen* ..... XVII

*Die Witterung des Jahres im Überblick* ..... LI

*Besondere Witterungsereignisse* ..... LII

**I *Tägliche Beobachtungen***

Beobachtungen von 16 Stationen ..... 1

Globalstrahlung und Sonnenscheindauer nach Tagessummen von 9 Stationen ..... 97

Sonnenscheindauer nach Tagessummen von 18 Stationen ..... 100

**II *Monats- und Jahresübersichten***

Übersichten von 205 Stationen ..... 106

Frost- und Schneedeckenzeiten von 187 Stationen ..... 188

Eis-, Frost- und Sommertage von 188 Stationen ..... 190

*Sonnenscheindauer*

Übersichten von 80 Stationen ..... 193

Tagesgang nach wahrer Ortszeit (je Monat und für das Jahr) von 35 Stationen ..... 198

Erdbodentemperaturen von 50 Stationen ..... 205

**III *Phänologische Beobachtungen***

Erläuterungen und Text zu den Karten 1 – 4 im Anhang ..... 215

Tabellen: Erklärung der Abkürzungen und Schlüssel zu den Zeitangaben ..... 216

Beobachtungsergebnisse aus den Internationalen Phänologischen Gärten ..... 217

A. Wildwachsende Pflanzen ..... 218

B. Landwirtschaftliche Kulturpflanzen ..... 228

C. Obst ..... 238

Karten siehe Anhang

**IV *Niederschlagsbeobachtungen***

Tägliche Niederschlagshöhen in Zehntel Millimeter zum Termin I (117 Stationen) ..... 248

Tägliche Schneehöhen in Zentimeter zum Termin I (34 Stationen) und Wasseräquivalent der Schneedecke (18 Stationen) ..... 272

Monatliche Niederschlagshöhen, Jahresübersichten von ca. 4500 Stationen ..... 278

Tägliche Niederschlagshöhen ≥ 50 mm ..... 328

**V *Ergebnisse der aerologischen Aufstiege***

Erläuterungen ..... 334

Monatliche Mittel- und Extremwerte für Druckstufen ..... 335

Monatliche Mittelwerte der Windgeschwindigkeit für Druckstufen, Erweiterung durch Zwischentermine ..... 344

Vertikaler Gradient der Lufttemperatur in 3 Schichten ..... 346

***Anhang***

Abbildung 1 und 2: Jahresgang des vertikalen Gradienten der Lufttemperatur

Abbildung 3 und 4: Jahresgang des Höhenwindes

Karte 1: Beginn der Schneeglöckchenblüte

Karte 2: Beginn der Apfelblüte

Karte 3: Beginn der Winterroggen-Vollblüte

Karte 4: Beginn der Winterroggen-Gelbreife

Karte 5: Verteilung der Stationen

Weitere Karten: Jahresmittel der Lufttemperatur in Grad C und Abweichung zum vieljährigen Mittel; Verteilung der jährlichen Niederschlagshöhen in Millimeter und Prozent.

# Einleitung

Die vorliegende Ausgabe des Deutschen Meteorologischen Jahrbuchs 1994 setzt die im Jahre 1953 begonnene Jahrbuchreihe für das Gebiet der Bundesrepublik Deutschland fort. Sie enthält die Beobachtungsergebnisse aller deutschen Bundesländer in einem Band.

Der Inhalt des Jahrbuchs hält sich in seinem Aufbau an die internationalen Vorschriften und die seit mehr als 100 Jahren befolgte Tradition, die Beobachtungsergebnisse in weitgehend gleichbleibender Form und Qualität über Jahrzehnte bzw. Jahrhunderte hinweg für die Interessenten im In- und Ausland zu bewahren und zugänglich zu machen.

Es werden von 16 Klimastationen (Extenso-Stationen) die täglichen Beobachtungen und von 205 Stationen Monats- und Jahreswerte veröffentlicht. Des weiteren erscheinen die Tagessummen der Globalstrahlung (siehe Hinweise auf Seite IV) und dazu die entsprechenden Werte der Sonnenscheindauer von 9 ausgewählten Stationen des Strahlungsmeßnetzes des Deutschen Wetterdienstes. Von sämtlichen Stationen werden die Monats- und Jahresübersichten der Niederschlagsbeobachtungen gebracht, von einigen Stationen auch die täglichen Niederschlags- und Schneedeckenhöhen. Einzelheiten der Jahrbuchveröffentlichung, insbesondere auch zu Abschnitt III (Phänologische Beobachtungen) und zu Abschnitt V (Ergebnisse der aerologischen Aufstiege), sind aus dem Inhaltsverzeichnis und den Erläuterungen ersichtlich. Umfassendes Wissen über die Beobachtungspraktiken im klimatologischen Dienst vermitteln die im Selbstverlag herausgegebene „Anleitung für die Beobachter des Deutschen Wetterdienstes" (9. Auflage 1986) und die „Anweisung für die Beobachter an Niederschlagsstationen" (Ausgabe 1989).

Die Terminbeobachtungen werden einheitlich nach **m**itte**l**europäischer **Z**eit um 7.30, 14.30, 21.30 Uhr MEZ (= Termin I, II, III) wahrgenommen. Für das Jahr 1994 wurde die **m**itte**l**europäische **S**ommer**z**eit (MESZ = MEZ + 1 Stunde bzw. UTC + 2 Stunden) vom 27.3., 02 Uhr, bis zum 25.9., 03 Uhr, als gesetzliche Zeit eingeführt. An den Klimastationen wurde in diesem Zeitraum entsprechend der Zeitverschiebung (MEZ + 1 Stunde) um 8.30, 15.30, 22.30 Uhr MESZ gemessen, an Niederschlagsstationen jedoch weiterhin um 7.30 Uhr gesetzlicher Zeit. Die damit verbundene Zeitverschiebung während der MESZ um −1 Stunde gegenüber dem Termin I an Klimastationen schmälert die Vergleichbarkeit der Werte nur geringfügig.

Von den in den Verzeichnissen angegebenen Stationen stehen die Beobachtungsergebnisse sowie umfangreiches über das Jahrbuch hinausgehendes Material auch auf elektronischen Datenträgern zur Verfügung.

Das Jahrbuch 1994 wurde in der Abteilung Klima und Umwelt, unter Leitung von Dr. E. Dittmann von Frau Chr. Hartmann (Abschnitt I, II, IV und Gesamtredaktion) unter Mithilfe von H.-J. Ansorge und Frau R. Knittel bearbeitet. Frau Ch. Polte-Rudolf stellte den Abschnitt III (Phänologische Beobachtungen) und Frau Dipl. Met. H. Nitsche den Abschnitt V (Ergebnisse der aerologischen Aufstiege) zusammen.

Offenbach am Main — Deutscher Wetterdienst

# Erläuterungen zu den Tabellen

Einleitende Zusammenstellungen

*Verzeichnis der Klimastationen in alphabetischer Reihenfolge* (siehe auch Karte 5 im Anhang):

Hier erscheinen alle Klimastationen, die 1994 in Betrieb waren und spezielle Sonnenscheinmeßstellen (gekennzeichnet mit ⊙ hinter dem Stationsnamen). Das Verzeichnis enthält folgende Angaben: Stationsname; Jahrbuch-Seitenzahl, soweit Ergebnisse hier erscheinen mit Hinweisen auf andere amtliche Veröffentlichungen; Sonderbeobachtungen/Registrierungen bestimmter Elemente; geographische Koordinaten; Stationshöhe (H = m über NN); Einrichtungsjahr (bei Verlegung im Nahbereich wurde, sofern meteorologisch vertretbar, das Einrichtungsjahr der vorangegangenen Station übernommen); Stationsleiter/in bzw. Beobachter/in (ehrenamtliche Beobachter sind nicht befugt, Klimadaten an Dritte abzugeben). Es bedeuten:

Ext. = Extenso-Station, tägliche Beobachtungen sind im Jahrbuch veröffentlicht
a = Monatswerte der meteorologischen Elemente im Monatlichen Witterungsbericht, Amtsblatt des Deutschen Wetterdienstes
b = Tägliche Niederschlagshöhen im Monatlichen Witterungsbericht, Amtsblatt des Deutschen Wetterdienstes
c = Tageswerte der Lufttemperatur im Monatlichen Witterungsbericht, Amtsblatt des Deutschen Wetterdienstes
d = Synoptische Beobachtungen im Europäischen Wetterbericht, Amtsblatt des Deutschen Wetterdienstes

Registrierung und/oder Terminmessung
E = der Erdbodentemperatur
G = der Globalstrahlung (direkte + diffuse Sonnenstrahlung)
⊙ = der Sonnenscheindauer mit Sonnenscheinautograph
S = der Sonnenscheindauer mit elektron. Meßsystem
B = des Luftdrucks
T = der Lufttemperatur
F = der Luftfeuchte
W = des Windes (Richtung und Geschwindigkeit)
* = hinter dem Einrichtungsjahr: Die Beobachtungen wurden länger als ein Jahr unterbrochen

*Verzeichnis der Niederschlagsstationen:*

Hier erscheinen, nach Ländern geordnet, sämtliche Stationen des Klimabeobachtungsnetzes, deren Niederschlagsdaten auf elektronischen Datenträgern routinemäßig zur Verfügung stehen. Das Verzeichnis enthält folgende Angaben: Stationsname; Kreis (wegen nicht abgeschlossener Kreisreform werden teilweise noch die bisherigen Kreisnamen angegeben, s.a. Hinweise im Verzeichnis); Seitenzahl der Veröffentlichung in den Monats- und Jahresübersichten (Abschnitt IV); Einrichtungsjahr (bei Verlegung im Nahbereich wurde, sofern meteorologisch vertretbar, das Einrichtungsjahr der vorangegangenen Station übernommen). Es bedeuten:
N hinter dem Stationsnamen = Tägliche Niederschlagshöhen sind ab Seite 248 bzw. 249 veröffentlicht
S hinter dem Stationsnamen = Tägliche Schneehöhen sind ab Seite 272 veröffentlicht
* hinter dem Einrichtungsjahr = Die Beobachtungen wurden länger als ein Jahr unterbrochen

*I Tägliche Beobachtungen (Seite 1–105)*

a) *Beobachtungen an 16 Stationen* (Extenso-Stationen, Seite 1–96)

*Angaben im Tabellenkopf:*

$\varphi$ = geographische Breite, $\lambda$ = geographische Länge, bezogen auf Greenwich, g = Fallbeschleunigung ($ms^{-2}$), H = Mittlere Höhe der Meßfeldfläche über Normalnull im unmittelbaren Bereich der Thermometerhütte, $H_p$ = Höhe des Barometers über Normalnull, $h_t$ = Höhe der Thermometer über dem Erdboden, $h_r$ = Höhe der Auffangfläche des Niederschlagsmessers über dem Erdboden.

In der Datumspalte, letzte Zeile, steht „MIT" für „mittlerer monatlicher Wert". Ausgenommen ist die Spalte Niederschlag; hier wird die „monatliche Niederschlagshöhe" angegeben.

*Beobachtungstermine:*

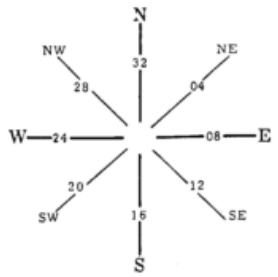
07.30, 14.30, 21.30 Uhr MEZ = Termin I, II, III.

*Luftdruck* (P) in Hektopascal (hPa)

auf 0 °C Quecksilbertemperatur und Normalfallbeschleunigung umgerechnet = Luftdruck in Barometerhöhe. Bei Werten von 1 000.0 hPa und mehr wurde jeweils die Tausendziffer weggelassen.

*Lufttemperatur (T) in Grad Celsius:*

Die Tagesmittel sind aus den drei Terminwerten berechnet nach der Formel $\frac{I + II + 2 \cdot III.}{4}$ Die Temperaturextreme werden zum Abendtermin (Termin III) für die vorhergehenden 24 Stunden abgelesen und dem Datum des Messungstages zugeschrieben.



*Dampfdruck (e) in Hektopascal (hPa).*

*Relative Luftfeuchte* (U) in Prozent:

Die Tagesmittel sind arithmetische Mittel aus den drei Terminwerten.

*Richtung des Windes* (D) in Schlüsselzahlen:

Die Bedeutung ist aus der folgenden Windrose ersichtlich:

Windstille (Calme) = 00

*Stärke des Windes* (F)

nach der Beaufortskala (0–12).

*Sichtweite* (V):

Die Sichtweite wird nach der Sichtbarkeit von ausgewählten Marken in bestimmten Entfernungen angegeben:

| Sichtweite..... | 0.05 | 0.2 | 0.5 | 1 | 2 | 4 | 10 | 20 | 50 | Gr. 50 |
|---|---|---|---|---|---|---|---|---|---|---|
| Marke nicht mehr sichtbar in einer Entfernung von | 50 m | 200 m | 500 m | 1 km | 2 km | 4 km | 10 km | 20 km | 50 km | über 50 km |

*Bewölkung* (N):

Die Spalte enthält die geschätzte Bewölkungsmenge nach neunteiliger Skala (0–8).0 = wolkenlos; 4 = die Hälfte des Himmels ist bedeckt; 8 = der Himmel ist ganz bedeckt.

*Niederschlag* (R):

Niederschlagshöhe in Millimeter zum Morgentermin (Termin I) für die vorhergehenden 24 Stunden aus den Terminmessungen errechnet und dem Datum des Vortages zugeschrieben. Dabei bedeuten:

Ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Niederschlagshöhe nicht meßbar (unter 0.05 mm) war und z.B. 1.0, daß 1.0 mm Niederschlagshöhe gemessen wurde, wobei 1 mm dem Niederschlagsvolumen von 1 Liter auf 1 Quadratmeter Bodenfläche entspricht.

In der Zeile „MIT" ist anstelle des Mittelwertes die monatliche Niederschlagshöhe angegeben.

*Schneedecke* in Zentimeter (Decke aus gefallenen festen Niederschlägen):

Schneehöhe gemessen zum Morgentermin (Termin I). Es bedeuten:

0, daß die Höhe der Schneedecke kleiner als 0.5 cm war; F (Flecken), daß weniger als die Hälfte der Erdoberfläche in der Umgebung der Meßstelle schneebedeckt war (Schneereste bleiben unberücksichtigt).

*Witterungsverlauf* (W):

Die Spalte enthält die Beobachtungen über die zwischen den Terminen III (des Vortages) bis I, I bis II und II bis III aufgetretenen Witterungserscheinungen, wobei nur die wesentlichsten – zusammengefaßt unter den nachfolgend erläuterten Zeichen – veröffentlicht werden.

| Zeichen | Erläuterungen | Zeichen | Erläuterungen |
|---|---|---|---|
| ◍ | Regen, Regenschauer, einzelne Regentropfen, Sprühregen, gefrierender Regen bzw. Sprühregen | ∾ | Glatteis (bei oder nach fallendem gefrierendem Niederschlag) |
| ✳ | Schneefall, Schneeschauer, einzelne Schneeflocken | ⩍ | Strahlungstau, Advektionstau, weißer Tau |
| △ | Frostgraupel, Reifgraupel, Schneegriesel, Eiskörner | ⌙ | Strahlungsreif, Advektionsreif |
| ▲ | Hagel | ⍁ | Gewitter über Beobachtungsort, Gewitter in der Umgebung des Beobachtungsortes (Ferngewitter) |
| ≡ | Nebel, Nebeltreiben (Sichtweite unter 1 km) | ⩎ | Starker Wind (Stärke 6 und 7 Beaufort) |
| ∨ | Nebelfrost: Rauhreif, Rauheis, Klareis | ⩏ | Stürmischer Wind (Stärke 8 Beaufort und mehr) |

b) *Tagessummen der Globalstrahlung und der Sonnenscheindauer* (Seite 97–99)

Stationsdaten und Koordinaten wie unter 1 a); $h_{Ra}$ = Höhe der Empfangsfläche des Pyranometers über dem Erdboden. $h_s$ und Weiteres siehe Abschnitt II d.

Globalstrahlung = Summe von direkter und diffuser Sonnenstrahlung auf eine horizontale Empfangsfläche in Joule pro Quadratzentimeter (J/cm²). Sonnenscheindauer in Stunden.

Hinweis: Eine spezielle Publikation von Strahlungsmeßwerten wird zukünftig in neuer Fassung erfolgen. Alle Ergebnisse des Strahlungsmeßnetzes stehen auch auf Diskette zur Verfügung und sind auf Anforderung beim Deutschen Wetterdienst (Meteorologisches Observatorium Potsdam, Telegrafenberg, 14473 Potsdam oder Niederlassung Hamburg, Bernhard-Nocht-Str. 76, 20359 Hamburg) erhältlich.

*c) Tagessummen der Sonnenscheindauer* (Seite 100–105)

Die Angaben über Lage und Aufstellung der Stationen sind in Abschnitt II dieses Jahrbuches enthalten.

*II Monats- und Jahresübersichten (Seite 106–214)*

a) *Übersichten von 205 Stationen* (Seite 106-187)

*Stationsdaten, Koordinaten* und Beobachtungstermine wie unter Ia).

*Luftdruck* (P) in Hektopascal (hPa):

$P_m$ = Monatsmittel des Luftdrucks auf 0 °C Quecksilbertemperatur und Normalfallbeschleunigung umgerechnet.

$P_{o,m} = P_m$ reduziert auf Meeresniveau, Normalnull (NN).

*Lufttemperatur* (T) in Grad Celsius:

Mittel und Extreme wie unter Ia): Lufttemperatur.

*Windverteilung:*

Im klimatologischen Beobachtungsdienst werden die Windrichtung und -stärke geschätzt, sofern keine direkt ablesbaren Meßgeräte vorhanden sind.

Die erste Spalte innerhalb jeder Windrichtung enthält die Anzahl der Beobachtungen der betreffenden Windrichtung und die zweite Spalte deren mittlere Stärke. Das Jahresmittel der mittleren Windstärke jeder Richtung ist kein einfaches arithmetisches Mittel der 12 Monatsmittel. Es ergibt sich als Quotient aus der Jahressumme der Windstärke der betreffenden Windrichtung und der Anzahl der Beobachtungen dieser Windrichtung innerhalb des Jahres.

*Dampfdruck* in Hektopascal (hPa):

Monatsmittel aus den Tagesmitteln berechnet, die arithmetische Mittel aus den Terminwerten sind.

*Relative Luftfeuchte* (U) in Prozent:

Mittel wie unter Dampfdruck. Das absolute Minimum ist der jeweils tiefste Terminwert des Monats.

*Bewölkung* (N):

Geschätzte Bewölkungsmenge nach neunteiliger Skala (0–8). Mittel wie unter Dampfdruck.

*Niederschlag* (R) in Millimeter:

Messungen wie unter Ia): Niederschlag. Der Jahreswert ist die Summe der auf ganze Millimeter gerundeten monatlichen Niederschlagshöhen. Die jeweils größte tägliche Niederschlagshöhe im Monat (Jahr) ist mit Datum für die einzelnen Monate angegeben.

*Anzahl der Tage* (n)

mit Temperatur-Maximum unter 0.0 °C (Eistage);

mit Temperatur-Minimum −10.0 °C oder tiefer;

mit Temperatur-Minimum unter 0.0 °C (Frosttage);

mit Temperatur-Maximum 25.0 °C oder höher (Sommertage);

mit Temperatur-Maximum 30.0 °C oder höher (heiße Tage);

mit Temperatur-Minimum 20.0 °C oder höher,

mit Windstärke (F) $\geqq$ 6 und $\geqq$ 8 Beaufort;

mit Bewölkung (N): Tagesmittel der Bewölkung < 1.6 (heitere Tage) und > 6.4 (trübe Tage);

mit Niederschlag (R): Anzahl der Tage mit Niederschlag $\geqq$ 0.1, $\geqq$ 1.0 und $\geqq$ 10.0 mm Höhe;

mit Regen (◍): Die tägliche Niederschlagshöhe beträgt mindestens 0.1 mm und besteht aus gefallenem flüssigem oder abgesetztem Niederschlag;

mit Schnee (✳) und Regen und Schnee (⁕): Die tägliche Niederschlagshöhe beträgt mindestens 0.1 mm und besteht ganz oder teilweise aus gefallenen festen Niederschlägen (Schnee, Hagel, Graupel);

mit Schneedecke (▣): Decke aus gefallenen festen Niederschlägen zum Termin I, Mindesthöhe ist 0 cm (Flecken und Reste bleiben unberücksichtigt);

mit Hagel (▲);

mit Graupel (⛆): Frostgraupel (△), Reifgraupel (⛇), Griesel (⛬) oder Eiskörner (△);

mit Nebel (≡): Sichtweite unter 1 km;

mit Gewitter: Gewitter über der Station ↯, Ferngewitter (↯).

b) *Frost- und Schneedeckenzeiten* (Seite 188–189)

Frostzeit: Datum des letzten und ersten Tages mit Temperaturminimum unter 0.0 °C.

Schneedeckenzeit: Datum des letzten und ersten Tages mit einer Schneedecke (Decke aus gefallenen festen Niederschlägen) von 1 cm oder mehr zum Termin I. Nicht berücksichtigt werden Decken, die allein aus Hagel oder Graupel entstanden sind.

c) *Eis-, Frost- und Sommertage* (Seite 190–192)

Anzahl der Eistage (Temperatur-Maximum unter 0.0 °C), Frosttage (Temperatur-Minimum unter 0.0 °C), Sommertage (Temperatur-Maximum 25.0 °C oder höher) für jeden Monat und das Jahr.

d) *Sonnenscheindauer* (Seite 193–204)

φ, λ wie unter Ia). $H_s$ = Mittlere Höhe des Erdbodens über Normalnull unter dem Meßgerät. $h_s$= Höhe des Meßgerätes über dem Erdboden. Die Werte werden aus Registrierungen mit Sonnenscheinautographen Campbell-Stokes oder mit fotoelektrischen Meßgeräten gewonnen. Aus dem Verzeichnis der Klimastationen ist ersichtlich, welche Werte für das Jahrbuch benutzt wurden. Die beiden Meßsysteme sind nur bedingt vergleichbar. Vereinzelt ergeben sich ab 1993 Differenzen bei Summenbildungen durch die Umrechnung von Minuten in Zehntelstunden.

e) *Erdbodentemperaturen* (Seite 205–214)

φ, λ und H wie unter Ia). Monats- und Jahresmittel in Grad Celsius errechnet aus den Terminwerten in 0.1, 0.2, 0.5 und 1 m Tiefe.

Das Maximum (Minimum) ist jeweils der höchste (tiefste) Terminwert.

Die Werte werden mit Flüssigkeits- oder elektrischen Widerstandsthermometern im unbewachsenen Erdboden gewonnen. Die Meßfühler sind unmittelbar in den Erdboden eingegraben. Nur die Flüssigkeitsthermometer in den Tiefen ab 0.5 m befinden sich im unteren Teil eines Holzkörpers mit Kupferkappe in einer in den Boden eingelassenen Röhre. Abweichend von den geltenden Vorschriften sind in den neuen Bundesländern die Flüssigkeitsthermometer bis 0.2 m Tiefe so installiert, daß sie von Süden her abgelesen werden müssen. Die Umstellung wird schrittweise vorgenommen.

*III Phänologische Beobachtungen (Seite 215–247)*

Erläuterungen siehe im Abschnitt selbst.

*IV Niederschlagsbeobachtungen (Seite 248–333)*

Die Stationen sind in Anlehnung an die Flußgebietsordnung aufgeführt. Neben den Stationsnamen sind die Stationshöhen (H) angegeben, die sich allgemein auf die mittlere Höhe des Erdbodens über Normalnull (NN) unter der Auffangfläche des Niederschlagsmessers beziehen. Außerdem wird die Höhe der Auffangfläche über dem Erdboden ($h_r$) in Fußnoten erwähnt, wenn sie mehr als 2 m über dem Erdboden liegt.

*Hinweis:* Im Monatlichen Witterungsbericht, Amtsblatt des Deutschen Wetterdienstes, werden von ausgewählten Stationen tägliche Niederschlags- und Schneedeckenhöhen sowie monatliche Niederschlagshöhen (mm) im Verhältnis zum vieljährigen Mittelwert (%) veröffentlicht.

*Tägliche Niederschlagshöhen (Seite 248–271)*

Messungen wie unter Ia): Niederschlag. Die Tabellen enthalten:

Tägliche Niederschlagshöhen in Zehntel Millimeter gemessen zum Termin I (dem Vortag zugeschrieben). Es bedeuten:

Ein Punkt, daß kein Niederschlag gefallen ist; 0, daß die Niederschlagshöhe nicht meßbar (unter 0.05 mm) war.

Monatliche Niederschlagshöhen in Zehntel Millimeter, Verhältnis (in %) und Abweichung (in mm) zum bzw. vom Mittelwert 1951–1980. Positive Abweichungen sind ohne Vorzeichen, negative Abweichungen werden durch ein Minuszeichen (–) kenntlich gemacht.

Anzahl der Tage mit Niederschlag von mindestens 0.1 und 1.0 mm Höhe sowie der Tage mit Schneefall (✱) und Schneedecke ( ▣ ) wie unter IIa).

*Tägliche Schneehöhen, Wasseräquivalent der Schneedecke (Seite 272–277)*

Die Tabellen enthalten:

Tägliche Schneehöhen in Zentimeter, gemessen zum Termin I. Um Platz einzusparen, erscheinen von den 34 ausgewählten Stationen nur die, die in dem betreffenden Monat eine Schneedecke von ≧ 0 cm Höhe oder Schneeflecken aufweisen. Es bedeuten:

Ein Punkt, daß eine Schneedecke (Decke aus gefallenen festen Niederschlägen) nicht gelegen hat; 0, daß die Höhe der Schneedecke kleiner als 0.5 cm war; F (Flecken), daß weniger als die Hälfte der Erdoberfläche in der Umgebung der Meßstelle schneebedeckt war (Schneereste bleiben unberücksichtigt).

Wasseräquivalent der Schneedecke zum Termin I an bestimmten, aus den Tabellen ersichtlichen Tagen von 18 ausgewählten Stationen. Die Stationen werden nur dann aufgeführt, wenn eine meßbare Schneeschicht vorliegt. Angegeben wird die ausgestochene Schneehöhe (in cm) und die aus dieser Schneeschicht gewonnene bzw. errechnete Schmelzwasserhöhe (in mm). Die Bestimmung erfolgt mit Hilfe eines Schneeausstechers (Blechzylinder von 200 cm² Öffnung) oder einer Schneesonde (Blechzylinder von 50 cm² Öffnung).

*Monatliche Niederschlagshöhen, Jahresübersichten (Seite 278–327)*

Messungen an Klimastationen wie unter Ia): Niederschlag. An Niederschlagsstationen wird überwiegend nur eine tägliche Messung zum Termin I vorgenommen; die Niederschlagshöhe wird dem Vortag zugeschrieben. Der Termin I liegt für diese Stationen in der Regel bei 07.30 Uhr gesetzlicher Zeit.

Die Tabellen enthalten:

Niederschlagshöhen für die Monate und das Kalenderjahr (Jahr) in mm sowie größte tägliche Höhe mit Datum; Anzahl der Tage mit Niederschlag von mindestens 0.1, 1.0 und 10.0 mm und Schneedecke ( ▣ ) wie unter II a); Niederschlagshöhen für das Wasserwirtschaftsjahr November 1993 bis Oktober 1994 (Jahr von XI–X); Anzahl der Tage mit Schneefall (✱).

Meßlücken sind im allgemeinen ergänzt worden. Ein waagrechter Strich wird gesetzt, wenn: keine Beobachtung vorliegt; eine Meßlücke nicht durch Interpolation oder mit den Werten vergleichbarer, benachbarter Stationen geschlossen werden konnte; eine Meßreihe im Laufe des Jahres beginnt oder endet (– in den Monatsspalten vor der Einrichtung bzw. nach Auflösung der Station).

*Größte tägliche Höhe mit Datum:*

Kommt dieser Niederschlagsmeßwert an einer Station mehrmals im Jahr vor, so wird nur das Datum des zeitlich ersten Auftretens angegeben.

*Anzahl der Tage mit Schneefall* (✱):

Es wird die Anzahl der Tage aufgeführt, an denen in der Zeit von jeweils 00 bis 24 Uhr Schnee, Hagel oder Graupeln im fallenden Niederschlag beobachtet wurde, unabhängig von der gemessenen Niederschlagshöhe. Die hiervon abweichende Definition unter IIa): Anzahl der Tage mit Schnee ( ✱ ) und Regen und Schnee ( ⁕ ) ist zu beachten.

*Tägliche Niederschlagshöhen* ≧ 50 mm *(Seite 328–333)*
Die Zusammenstellung enthält sämtliche tägliche Höhen von 50 mm und mehr mit dem dazugehörigen Datum.

*Fußnoten:*

Auf Veränderungen an den Stationen wird nur noch in gekürzter Form hingewiesen. So werden Neueinrichtungen und Auflösungen von Stationen lediglich in besonderen Fällen erwähnt, da sie im allgemeinen an den waagrechten Strichen in den Spalten der Vor- bzw. Folgemonate zu erkennen sind. Ist am Veränderungsdatum keine Jahreszahl angegeben, bezieht sich das Datum (Tag/Monat) auf den vorliegenden Jahrgang. Wurden größere Meßlücken mit Ersatzwerten geschlossen, wird – sofern diese der Redaktion bekannt wurden – auf die Ruhezeit der Station hingewiesen, wenn sie länger als einen Monat andauerte.

*V Ergebnisse der aerologischen Aufstiege (Seite 334–347)*

Erläuterungen siehe im Abschnitt selbst.

# 1994 Die Witterung des Jahres im Überblick

Das **Jahr 1994** war im Vergleich zu den vieljährigen Mittelwerten zu warm und - bei Betrachtung der Flächenmittel des Niederschlags für die deutschen Bundesländer - allgemein zu naß, nur in Bayern südlich der Donau war es zu trocken. Dabei erreichte die Sonnenscheindauer überdurchschnittliche Werte und blieb im Norden örtlich und im Süden gebietsweise unter dem Durchschnitt.

Die Jahresmittel der **Lufttemperatur** lagen zwischen -3.6 °C auf den Gipfeln der Alpen und 12.8 °C in der Ortenau (Kehl/Rhein), in den meisten Gebieten Deutschlands zwischen 8 und 12 °C.
Die **Abweichungen** der Jahresmitteltemperaturen von den vieljährigen Durchschnittswerten reichten von 0.7 K in Ostfriesland bis 2.8 K in Niederbayern. Sie lagen vorwiegend in der Nordhälfte unter 1.5 K und in der Südhälfte über 1.5 K. Im überwiegenden Teil Deutschlands war es zwischen 1 und 2 K zu warm.

Die **Jahresmaxima** der Lufttemperatur wurden meist Anfang August und zum Teil im Juli gemessen, in den Alpen und in Niederbayern vereinzelt auch im Juni. Die Werte lagen zwischen 15.2 °C auf der Zugspitze und 39.6 °C in Gera-Leumnitz.
Die **Jahresminima** der Lufttemperatur traten fast überall zwischen dem 13. und 25. Februar auf, nur vereinzelt wurden sie in der 2. Januarhälfte gemessen. Die Werte lagen zwischen -21.9 °C auf der Zugspitze und -5.7 °C in List auf Sylt bzw. in Freiburg i.Br.

**Sommertage** zählte man meist 25 bis 50, über 50 vor allem im Südwesten und Süden, unter 25 nur an den Küsten, in den höheren Mittelgebirgen und Alpen. In den Hochlagen der Alpen und auf dem Feldberg/Schw. gab es keine Sommertage. Die im vieljährigen Durchschnitt zu erwartenden Werte wurden auf den Berggipfeln erreicht, in den übrigen Gebieten aber um bis zu 31 Tage überschritten.

**Heiße Tage** wurden überwiegend 10- bis 20mal registriert. Weniger als 10 Tage ergaben sich an den Küsten, in den meisten Mittelgebirgen und in den Alpen, wobei auf Helgoland und Teilen Rügens sowie in den Hochlagen der Gebirge heiße Tage nicht verzeichnet wurden. In tieferen Lagen (die norddeutsche Tiefebene ausgenommen) zählte man verbreitet auch mehr als 20 Tage (am Hochrhein südlich vom Kaiserstuhl 31). Die zu erwartende Anzahl von heißen Tagen ist damit nur auf Gipfeln und Inseln eingetreten bzw. geringfügig unterschritten, sonst bis zu 23 Tage (Oberfranken) überschritten worden.

Die Zahl der **Frosttage** lag verbreitet zwischen 25 und 100 Tagen. Mehr als 100 Tage zählte man vor allem in den Gebirgen und mehr als 150 Tage teilweise auf den Gipfeln der Mittelgebirge und in den Hochlagen der Alpen (Zugspitze 289). Der vieljährige Durchschnitt wurde damit um 13 (Harz) bis 67 Tage unterschritten.

**Eistage** verzeichnete man überwiegend an bis zu 30 Tagen, nur im Westen und Südwesten gab es örtlich keine Eistage. Mehr als 50 Tage wurden in höheren Lagen der großen Mittelgebirge sowie in den Hochlagen der Alpen (Zugspitze 198) festgestellt. Der vieljährige Durchschnitt wurde damit um 4 (obere Isar) bis 37 Tage (Thüringer Wald) unterschritten.

Die jährlichen **Niederschlagshöhen** reichten von 400 mm (Rheinhessen) bis 2450 mm (Oberallgäu) und lagen meist zwischen 500 und 1000 mm.
Weniger als 500 mm registrierte man nur in kleinen Gebieten im äußersten Nordosten sowie im südlichen Westen. Mehr als 1000 mm ergaben sich vor allem in den Mittelgebirgen und verbreitet südlich der Donau aber auch in kleineren Gebieten im Norden und Nordwesten. Mehr als 2000 mm wurden im Oberharz, in den Hochlagen vom Schwarzwald, im Allgäu und gebietsweise in den Alpen gemessen.
Als **prozentuale** Anteile der Niederschläge an den vieljährigen Mittelwerten errechnete man zwischen 76 % (untere Loisach) und 163 % (Bersenbrücker Land), vorwiegend aber zwischen 100 und 150 %. Unter 100 % blieben die Werte in teils größeren, teils kleineren Gebieten in Ostfriesland, im Nordosten und Westen sowie in der Südhälfte Deutschlands. Mehr als 150 % errechnete man nur vereinzelt im norddeutschen Flachland sowie in der Mitte und im Osten.
Der prozentuale Anteil der **Flächenmittel** des Niederschlags zum vieljährigen Mittelwert zeigt, daß das Soll nur in Bayern südlich der Donau um 6 %-Punkte unter-, sonst um 3 %-Punkte (Bayern nördlich der Donau) bis 27 %-Punkte (Sachsen-Anhalt) überschritten wurde. Somit war es in Deutschland insgesamt zu naß (113 % = 864 mm).

Die **Anzahl der Tage mit Niederschlag** von mindestens 0.1 mm lag überwiegend bei 150 bis 200 Tagen. Mehr als 200 Tage wurden gebietsweise im Norden bis Westen, in den meisten Mittelgebirgen und verbreitet südlich der Donau gezählt. Unter 150 Tage ergaben sich nur an der mittleren Bode und in Rheinhessen. Die Abweichungen vom vieljährigen Durchschnitt waren schon auf kurzen Entfernungen recht unterschiedlich. Es sind negative Abweichungen bis 23 Tage (Nordostrand des Rothaargebirges) und positive Abweichungen bis 50 Tage (Berchtesgadener Alpen) aufgetreten.

Die Anzahl der Tage mit Niederschlag von mindestens 1.0 mm betrug meist 100 bis 150 Tage. Wobei mehr als 150 Tage gebietsweise im Norden bis Westen, in den Gebirgslagen und teilweise im Alpenvorland und weniger als 100 Tage örtlich an der Nahe und im Osten vorkamen. Die Werte des vieljährigen Durchschnitts wurden vereinzelt im äußersten Norden und gebietsweise im Mittelgebirgsraum bis zu 29 Tage (Edertal) unter-, sonst bis zu 30 Tage (Südschwarzwald) überschritten.

Niederschlagshöhen von 10.0 mm und mehr gab es an 10 bis 50 Tagen, an mehr als 50 Tagen im Harz, Rothaar- und Ebbegebirge, Schwarzwald, Westallgäu und in den Alpen. Damit wurde der vieljährige Durchschnitt vereinzelt im Norden und gebietsweise im Süden bis zu 19 Tage (Mangfallgebirge) unter-, sonst bis zu 21 Tage (Harz) überschritten.

Die **Anzahl der Tage mit gefallenen festen Niederschlägen** von mindestens 0.1 mm lag überwiegend zwischen 10 und 50 Tagen, in den höheren Mittelgebirgen, am Alpenrand und in den Alpen bei mehr als 50 Tagen. Mehr als 100 Tage kamen örtlich im Harz, Thüringer Wald, Erzgebirge, Böhmerwald und Südschwarzwald sowie in den Alpen vor. Der vieljährige Durchschnitt wurde vereinzelt in tieferen Lagen bis zu 25 Tage (Helgoland) und im Gebirge bis zu 33 Tage (Zugspitze) über-, sonst verbreitet bis zu 20 Tage (Flußtäler) unterschritten.

Eine **Decke aus gefallenen festen Niederschlägen** bildete sich an 1 bis 50 Tagen. Schneedeckenfrei blieb es nur eng begrenzt an Hochrhein und Regnitz. Mehr als 50 Tage wurden in den meisten Mittelgebirgen, abschnittsweise am Alpenrand und in den Alpen beobachtet, wobei sich in den Hochlagen der Mittelgebirge und auf den Gipfeln, in den Alpentälern vereinzelt und in den höheren Lagen der Alpen mehr als 100 Tage ergaben. Im vieljährigen

Durchschnitt sind in den tieferen Lagen bis 50 Tage und in den Gebirgen mehr als 100 Tage zu erwarten. Diese Werte wurden nur vereinzelt in Gipfellagen erreicht bzw. bis zu 6 Tage (Thüringer Wald) über-, sonst bis zu 59 Tage (Tallagen in den Berchtesgadener Alpen) unterschritten.

**Gewitter** traten meist an 10 bis 40 Tagen auf. 10 Tage und weniger gab es nur vereinzelt im norddeutschen Tiefland. Mehr als 40 Tage zählte man vor allem im Südwesten -dort örtlich um 50 Tage- und in den höheren Gebirgslagen. Dabei wurde gebietsweise - meist im Gebirge- an bis zu 8 Tagen Hagel beobachtet. Der vieljährige Durchschnitt bei Gewittertagen beträgt 8 (untere Saale) bis 40 Tage (Südschwarzwald). Diese Werte wurden im Norden und Osten verbreitet und in kleineren Gebieten bis zu 14 Tage unterschritten, sonst überwiegend bis zu 22 Tage überschritten.

Als **mittlere tägliche Bewölkung** ergaben sich um 5 bis 6 Achtel. Unter 5 Achtel blieben die Werte nur abschnittsweise im Nordosten sowie in kleineren Gebieten im Westen und von der Mitte bis zum Niederbayerischen Hügelland sowie örtlich in Leegebieten. Mehr als 6 Achtel wurden nur auf den Gipfeln der Mittelgebirge sowie eng begrenzt in ungünstigen Lagen beobachtet. Im vieljährigen Durchschnitt sind 4.9 bis 6.4 Achtel zu erwarten. Diese Werte wurden nur vereinzelt um ca. 1 Achtel überschritten (Schwäbische Alb) bzw. unterschritten (Leegebiete meist im Süden).

Die Anzahl der **heiteren Tage** lag meist zwischen 25 und 45 Tagen. Vereinzelt wurden örtlich auch mehr als 50 Tage erreicht und gebietsweise im Norden und in der Westhälfte zwischen 10 bis 25 Tage verzeichnet. Im vieljährigen Mittel sind 12 bis etwa 80 Tage zu erwarten. Diese Werte wurden nur in kleineren Gebieten im Norden und im Lee von Gebirgen bis zu 35 Tage überschritten, sonst bis zu 20 Tage, örtlich bis 45 Tage, unterschritten.

**Trübe Tage** zählte man in den meisten Gebieten zwischen 100 und 200, nur ganz vereinzelt meist in Gipfellagen mehr als 200 Tage und in Leegebieten der Südhälfte weniger als 100 Tage. Der vieljährige Durchschnitt beträgt 115 bis 233 Tage. Er wurde örtlich im Norden sowie gebietsweise in der Südwesthälfte bis zu 30 Tage, in ungünstigen Lagen bis 70 Tage, überschritten, sonst bis etwa 70 Tage unterschritten.

Die **Gesamtsonnenscheindauer** erreichte Werte von 1094 Stunden (in engen Alpentälern) bis 1958 Stunden (auf Rügen), überwiegend wurden 1400 bis 1800 Stunden gemessen. Mehr als 1800 Stunden gab es auf Helgoland und Sylt, abschnittsweise an der Ostsee, bei Berlin und Halle sowie in Südbayern. Weniger als 1400 Stunden schien die Sonne örtlich an der Mittelweser, in einigen Mittelgebirgen und in den Alpen östlich des Inn. Im Vergleich zum vieljährigen Mittel waren das Werte von 78 % im Nordschwarzwald bis 117 % in den Räumen Düsseldorf und Leipzig-Halle/Saale. Nur in kleineren Gebieten im Nordwesten und Norden sowie gebietsweise in der Südhälfte blieben die Werte unter 100 %. Überwiegend wurden 100 % und mehr erreicht.

## Besondere Witterungsereignisse

**Januar**
Am 27. und 28. verursachte ein Orkantief mit Spitzenböen bis 183 km/h auf Berggipfeln und bis 157 km/h im Flachland große Schäden in weiten Teilen Deutschlands. In Hamburg wurde dabei die zweithöchste Sturmflut seit Beginn der Aufzeichnungen festgestellt. Die nachfolgenden Schneefälle führten zu einem Verkehrschaos auf den Straßen in Mittelgebirgslagen mit zahlreichen Massenunfällen.

**April**
Vom 12. bis 15. führten verbreitete Starkniederschläge, die teilweise als Schnee fielen, zu katastrophalen Situationen in Bayern, Sachsen, Sachsen-Anhalt und Thüringen. In Bayern brachen durch die Last des nassen Schnees Fernleitungen und Masten, Geröll oder abgehende Muren blockierten Straßen und Eisenbahntrassen. Die Nebenflüsse der Saale führten gefährliches Hochwasser. Durch Dammbrüche waren einzelne Ortschaften vom Hochwasser eingeschlossen.

**Mai**
Die Starkniederschläge vom 18. (mit 80.3 mm höchster Tageswert in Freiburg i.Br. seit 1869) verursachten in Baden-Württemberg Überschwemmungen. Es mußten Straßen gesperrt und die Schiffahrt vorübergehend eingestellt werden.

**Juni/Juli/August**
An verschiedenen Tagen richteten in diesen Monaten schwere Gewitter mit Sturmböen, extremen Starkniederschlägen, Blitz- und Hagelschlag gebietsweise erhebliche Schäden an. Dabei wurden örtlich bis zu taubeneigroße Hagelkörner festgestellt.

Am 9. Juni bildete sich im Kreis Wernigerode eine bis zu 20 cm hohe Hagelschicht.

Östlich von Aachen verursachte am 4. Juli eine Trombe von ca. 100 m Durchmesser eine 400 m lange Verwüstungsschneise. Die Niederschlagsstation Bad Soden-Salmünster meldete am 18. Juli zwischen 15.15 Uhr und 16.15 Uhr Starkniederschläge mit einer Höhe von 109 mm.

Anfang August kam es im Osten (Lausitz) durch anhaltende Hitze und Dürre zu Waldbränden. Mit 39.6 °C wurde am 5. August in Gera-Leumnitz das höchste Maximum der Lufttemperatur dieses Jahres gemessen. Am 23. August vernichtete Hagelschlag z. B. in der Pfalz auf 500 Hektar Rebfläche die Ernte zu 50 bis 100 %.

[1] Korrektur $h_S = 9.7$ m seit April 1992.
[2] Die Messung der Globalstrahlung wird ab 1. 1. 1979 beim Meteorologischen Observatorium in Hamburg-Sasel vorgenommen: $\varphi = 53°\,39'$ N, $\lambda = 10°\,07'$ E, $H_S = 36$ m, $h_{Ra} = 13$ m. Hamburg-Fuhlsbüttel von IV bis IX $h_S = 1.2$ m wegen Sonnenaufstellung.
[3] Die Messung der Globalstrahlung wird vom Meteorologischen Observatorium am Standort Ravensberge vorgenommen: $\varphi = 52°\,22'$ N, $\lambda = 13°\,05'$ E, $H_S = 89$ m, $h_{Ra} = 18$ m.
**** Messung ausgefallen oder gestört.

1) Die Windbeobachtungen sind im November zeitweise ausgefallen.
2) Luftdruckwerte von Trier-Petrisberg: $\varphi$ = 49° 45' N, $\lambda$ = 6° 40' E, H = 265 m, $H_\phi$ = 273.2 m.
3) Die auf NN reduzierten Luftdruckwerte erscheinen etwas zu hoch.
