INFORMATION

Klimakarten des DWD

Als Leserin oder Leser des WitterungsReports wissen Sie sicher, dass Informationen zu Wetter und Klima auf verschiedene Weise dargestellt werden können. Für einen raschen und aussagekräftigen Überblick über die klimatischen Verhältnisse in einer Region, einem Bundesland oder in ganz Deutschland sind Karten gut geeignet - und deshalb in Meteorologie und Klimatologie auch weit verbreitet.
Logisch, dass auch der DWD eine große Vielzahl von Klimakarten bereitstellt.

Unsere Klimakarten stellen z.B. **Temperatur**, **Niederschlag** und **Sonnenscheindauer**, meist als Mittelwerte über viele Jahre, dar. Für die Nutzung der Windenergie stehen Karten mit den mittleren **Windgeschwindigkeiten** in verschiedenen Höhen über Grund zur Verfügung, während zu Fragen der Sonnenenergie unsere Karten zur **Globalstrahlung** gerne verwendet werden. Letztere gibt es auch für einzelne Monate und Jahre. Für die Analyse des räumlich unterschiedlichen Bedarfs an Heizenergie stellen wir Ihnen Karten der **Gradtagszahlen** für ganz Deutschland bereit.

Besondere Informationen für die Regional- und Landesplanung geben unsere Klima*eignungs*karten. Den Karten können Hinweise zu **Kaltluftflüssen**, zur **Durchlüftung**, zum **Bioklima** und zum **Erholungswert** eines Planungsgebietes entnommen werden. Sie werden mit Klimasimulationsmodellen unter Nutzung hoch aufgelöster Geländeinformationen erstellt.

Die Klimakarten des DWD gibt es je nach Thema in Auflösungen von 25m bis 1km Rasterweite, für unterschiedliche Gebiete und für verschiedene Zeiträume, in verschieden Ausführungen - so, wie es die meisten unserer Nutzer wünschen.

Näheres zu den Klimakarten des DWD finden Sie auf unserer Internetseite

Aktuelle Ergebnisse des Klimamonitorings

Klimastatusbericht des Deutschen Wetterdienstes

Der Deutsche Wetterdienst veröffentlicht seit 1998 den "Klimastatusbericht", der als nationaler Beitrag zum Klimamonitoring über die klimatischen Verhältnisse des jeweils vergangenen Jahres vorwiegend in Deutschland informiert. In jährlich wiederkehrenden Beiträgen wird über

- die Witterung in Deutschland
- die phänologische Entwicklung
- Ergebnisse aus Messungen in der freien Atmosphäre
- die Entwicklung der Ozonschicht
- die objektive Klassifikation von Wetterlagen sowie
- die saisonale Abweichung der Gebietsniederschläge in Europa

des vergangenen Jahres berichtet.

Darüber hinaus werden in Hintergrund- und Fachartikeln spezielle, klimabezogene Themen behandelt, die im besonderen Interesse von Öffentlichkeit und Forschung stehen.

INFORMATION

Ihr Weg zu Klima-Informationen im Internet

www.dwd.de/klimaauskunft

Beratungen und *Auskünfte zu Messwerten* von Temperatur, Niederschlag, Wind, Wetter und vieles, vieles mehr.

www.dwd.de/windkarten

Unsere Karten der *mittleren Windgeschwindigkeit* - und Sie wissen, wo der Wind weht!

www.dwd.de/planungsgutachten

Mit dem Klima planen. Wir sagen Ihnen, wie sich Ihr *Bauvorhaben* auf die Lufthygiene oder das Lokalklima auswirkt.
Auch für Umweltverträglichkeitsprüfungen.

www.dwd.de/witterungsreport

WitterungsReport - die Zeitnahe und sichere Informationsquelle über Wetter und Klima in Deutschland. Mit umfangreichen Daten, Grafiken, Texten und Statistiken.

www.dwd.de/wibe

Aktuell und preiswert: der Wöchentliche *Witterungsbericht* bietet punktgenau Daten von repräsentativen Stationen in Ihrer Nähe und gleichzeitig einen Überblick über ganze Bundesländer. Jeden Montag neu und nur Online!

www.dwd.de/gradtagzahlen

Die *Gradtagzahl* - eine Heiztechnische Kenngröße, für die Sie sich erwärmen können.

www.dwd.de/globalstrahlung

Der DWD kann für die meisten Länder der Welt *repräsentative Globalstrahlungsdaten*, -karten und -gutachten liefern.

www.dwd.de/lastgutachten

Wir ermitteln für Sie *meteorologische Lasten*, z.B.: Windlast, Eislast, Schneelast.

www.dwd.de/sv-ga

Unfall? Versicherungsschaden? Unsere *Sachverständigen-Gutachten* stellen eindeutig fest, ob das Wetter schuld war.

www.dwd.de/windenergie-gutachten

Wer in den Wind investiert, kann mit dem DWD rechnen: wir ermitteln das *Windenergie*-Potenzial und die mittlere jährliche Stromerzeugung für Ihren Standort und Ihre Konverter.

www.dwd.de/ausbreitungsklassen

Sie führen als Fach-Ingenieur oder Gutachter *Ausbreitungsrechnungen* durch? Dazu benötigen Sie meteorologische Informationen in besonders aufbereiteter Form? Wir helfen Ihnen weiter!

www.dwd-shop.de

Kaufen im Wettershop - einfach Artikel auswählen mit "click & buy" bezahlen, herunterladen, fertig!
!! Wird zum 30.09.2004 geschlossen !!

WIBE - Wöchentlicher Witterungsbericht

Der WitterungsReport liefert Ihnen als Monatsheft fundierte Informationen zu Wetter und Klima, entweder schnell und übersichtlich im WitterungsReport *Express* oder detailliert im WitterungsReport Daten. Manchmal kommt es aber darauf an, ganz besonders schnell und amtlich eine Aussage zum Wetter der letzten Tage zu bekommen. Übersichtlich soll der Wetterverlauf dargestellt werden, mit offiziellen Messwerten soll er belegt sein, und es soll nur ein niedriger Preis zu entrichten sein. WIBE - der wöchentliche Witterungsbericht des DWD erfüllt diese Anforderungen.

Schon zu Wochenbeginn können Sie belegen, wie das Wetter während der letzten 7 Tage war. Punktgenau und gleichzeitig ein Überblick über eine ganze Region. Für jeden Tag finden Sie in WIBE die 5 wichtigsten Daten von 14 repräsentativen Stationen in jedem WIBE-Bereich, als übersichtliche Zahlen und in klaren anschaulichen Grafiken, erläutert mit knappen und verständlichen Texten.

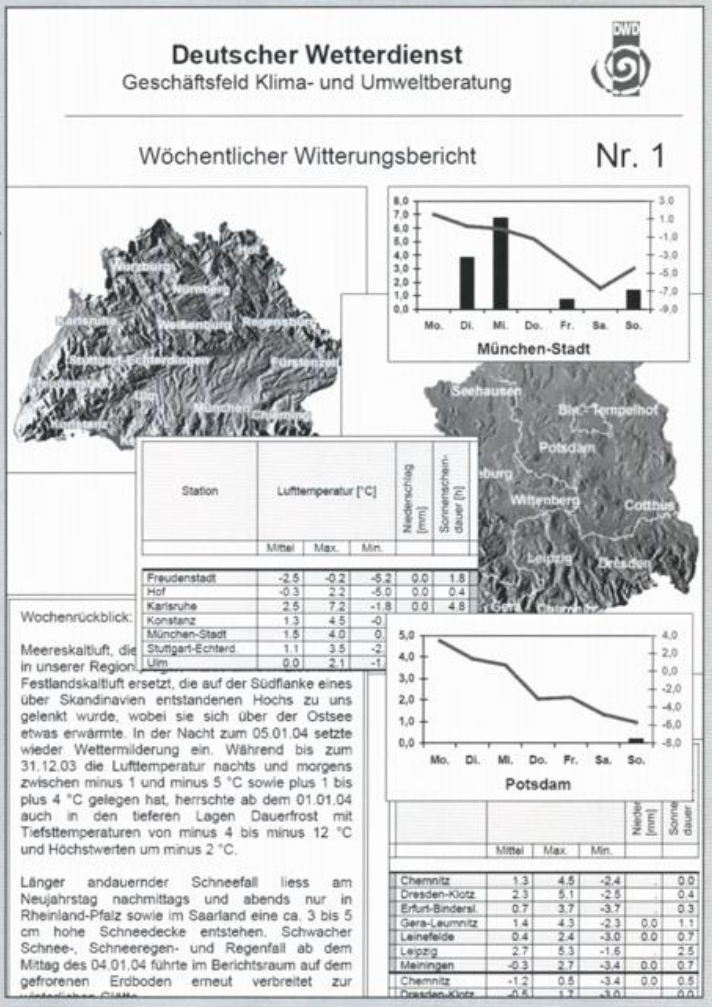

WIBE - den wöchentlichen Witterungsbericht gibt es für die Regionen

- Schleswig-Holstein, Mecklenburg-Vorpommern, Niedersachsen, Hamburg und Bremen
- Berlin, Brandenburg, Sachsen-Anhalt, Sachsen und Thüringen
- Nordrhein-Westfalen
- Hessen, Rheinland-Pfalz und Saarland
- Bayern und Baden-Württemberg

Damit es schnell geht, gibt es den WIBE nur elektronisch als Datei im PDF-Format. Wenn Sie WIBE abonnieren, senden wir Ihnen jede Woche eine E-mail mit dieser Datei, meistens montags, manchmal dienstags, für 92,80 EUR (inkl. MwSt.) 1 ganzes Jahr lang.

Wenn Sie WIBE nur ab und zu einmal haben möchten, stehen Ihnen einzelne WIBE-Ausgaben online zur Verfügung: im WetterShop des DWD unter **www.dwd-shop.de ***, für 2,90 EUR (inkl. MwSt.).

Kostenlose Beispiele für WIBE - den wöchentlichen Witterungsbericht gibt es unter www.dwd.de/witterungsreport. Klicken Sie dort auf WIBE - Wöchentlicher Witterungsbericht.

Die gemeldete Auflösung des 'dwd-shops' in der Februarausgabe des WRD ist falsch. Geschlossen wird der www.dwd-inshop.de!

WIBE - Wöchentlicher Witterungsbericht

Der WitterungsReport liefert Ihnen als Monatsheft fundierte Informationen zu Wetter und Klima, entweder schnell und übersichtlich im WitterungsReport *Express* oder detailliert im WitterungsReport Daten. Manchmal kommt es aber darauf an, ganz besonders schnell und amtlich eine Aussage zum Wetter der letzten Tage zu bekommen. Übersichtlich soll der Wetterverlauf dargestellt werden, mit offiziellen Messwerten soll er belegt sein, und es soll nur ein niedriger Preis zu entrichten sein. WIBE - der wöchentliche Witterungsbericht des DWD erfüllt diese Anforderungen.

Schon zu Wochenbeginn können Sie belegen, wie das Wetter während der letzten 7 Tage war. Punktgenau und gleichzeitig ein Überblick über eine ganze Region. Für jeden Tag finden Sie in WIBE die 5 wichtigsten Daten von 14 repräsentativen Stationen in jedem WIBE-Bereich, als übersichtliche Zahlen und in klaren anschaulichen Grafiken, erläutert mit knappen und verständlichen Texten.

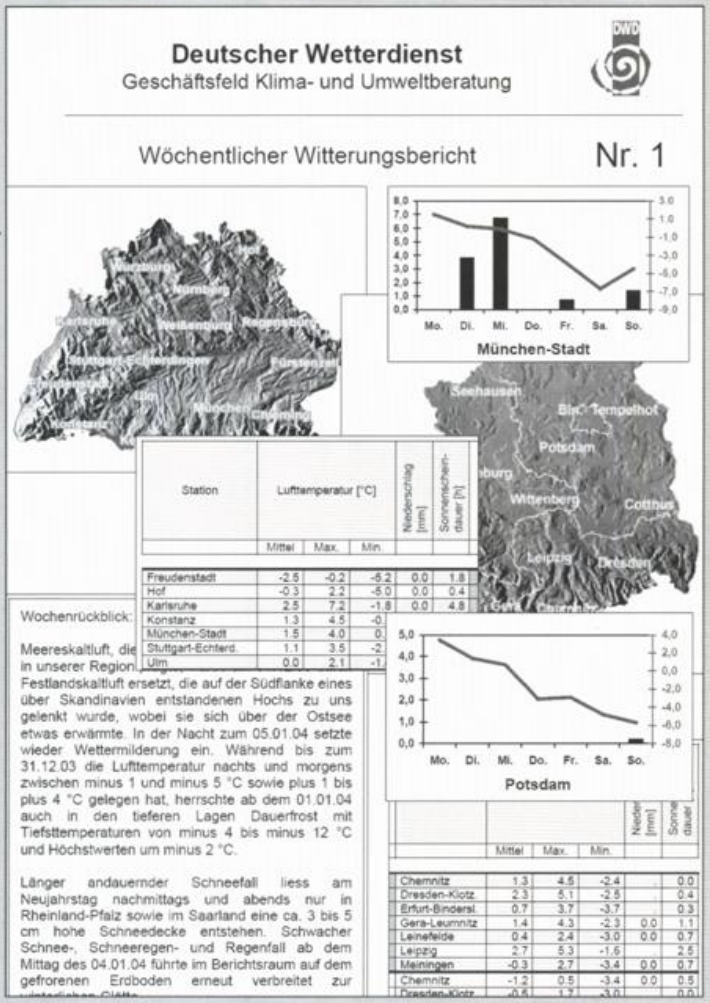

WIBE - den wöchentlichen Witterungsbericht gibt es für die Regionen

- Schleswig-Holstein, Mecklenburg-Vorpommern, Niedersachsen, Hamburg und Bremen
- Berlin, Brandenburg, Sachsen-Anhalt, Sachsen und Thüringen
- Nordrhein-Westfalen
- Hessen, Rheinland-Pfalz und Saarland
- Bayern und Baden-Württemberg

Damit es schnell geht, gibt es den WIBE nur elektronisch als Datei im PDF-Format. Wenn Sie WIBE abonnieren, senden wir Ihnen jede Woche eine E-mail mit dieser Datei, meistens montags, manchmal dienstags, für 92,80 EUR (inkl. MwSt.) 1 ganzes Jahr lang.

Wenn Sie WIBE nur ab und zu einmal haben möchten, stehen Ihnen einzelne WIBE-Ausgaben online zur Verfügung: im WetterShop des DWD unter **www.dwd-shop.de** *, für 2,90 EUR (inkl. MwSt.).

Kostenlose Beispiele für WIBE - den wöchentlichen Witterungsbericht gibt es unter www.dwd.de/witterungsreport. Klicken Sie dort auf WIBE - Wöchentlicher Witterungsbericht.

München-Stadt	1.5	4.0	0.		
Stuttgart-Echterd.	1.1	3.5	-2.		
Ulm	0.0	2.1	-1.		

Wochenrückblick:

Meereskaltluft, die ... in unserer Region ... Festlandskaltluft ersetzt, die auf der Südflanke eines über Skandinavien entstandenen Hochs zu uns gelenkt wurde, wobei sie sich über der Ostsee etwas erwärmte. In der Nacht zum 05.01.04 setzte wieder Wettermilderung ein. Während bis zum 31.12.03 die Lufttemperatur nachts und morgens zwischen minus 1 und minus 5 °C sowie plus 1 bis plus 4 °C gelegen hat, herrschte ab dem 01.01.04 auch in den tieferen Lagen Dauerfrost mit Tiefsttemperaturen von minus 4 bis minus 12 °C und Höchstwerten um minus 2 °C.

Länger andauernder Schneefall liess am Neujahrstag nachmittags und abends nur in Rheinland-Pfalz sowie im Saarland eine ca. 3 bis 5 cm hohe Schneedecke entstehen. Schwacher Schnee-, Schneeregen- und Regenfall ab dem Mittag des 04.01.04 führte im Berichtsraum auf dem gefrorenen Erdboden erneut verbreitet zur

INFORMATION

Im Zweifelsfalle:
Amtliche Gutachten beweisen, wie das Wetter wirklich war!

War das Wetter wirklich schuld?
War's der Blitz? Oder Bruder Leichtsinn? Hagelschlag? Oder Hammerschlag? Nebel? Oder benebelt?
Glatteis? Oder eiskalt gelogen? Wolkenbruch? Oder gebrochenes Wasserrohr?
Orkantief? Oder hochgradige Schlamperei am Bau?

Unser Gutachten gibt eindeutig Antwort. Schriftlich und amtlich.

Für Versicherungen, Polizei, Justiz, Architekten, Bauwillige, Bauunternehmer, Hauseigentümer, Grundbesitzer und für tatsächlich Geschädigte wird eine zuverlässige Antwort auf die Frage "Wo war wann und wie das Wetter?" immer wichtiger.
Oder aber: Wer hätte nicht gerne gewusst, ob sich das angebotene Baugrundstück als ein Regen- und Nebelloch entpuppt. Oder als hochwassergefährdetes Gebiet? ...

Im Zweifelsfalle: Beweisen, wie das Wetter wirklich war.

Einen begründeten Verdacht oder Recht haben, heißt noch lange nicht, Recht bekommen. Hier gibt ein Gutachten oft entscheidende Hinweise und damit den Ausschlag. Voraussetzung: Es handelt sich um ein fundiertes, eindeutiges, ausführliches und objektives Gutachten! Von erfahrenen Sachverständigen des Deutschen Wetterdienstes erstellt. Nach bestimmten, bewährten Kriterien mit zertifizierter Qualität. Aufgrund ständiger Beobachtungen, exakter Werte und Daten.

Ein amtliches Gutachten eben. Worauf Sie sich verlassen können.

Ein Sachverständigengutachten des Deutschen Wetterdienstes basiert auf eindeutigen Fakten: Auf Wetterkarten sowie Mess- und Beobachtungsdaten, die bundesweit erfasst werden.

Kein Buch mit sieben Siegeln.

Obwohl professionell und mit wissenschaftlicher Akribie erstellt, sind alle DWD-Gutachten verständlich gehalten. Je nach Auftrag werden allgemeine Wetterlagen und Witterungsverhältnisse beschrieben, Mess- und Beobachtungsdaten sowie Eintragungen des Beobachters über besondere Wetterereignisse berücksichtigt. Angaben, die nicht im luftleeren Raum stehen; sondern in Schlussfolgerungen nach bestem Wissen und Gewissen ausgewertet und objektiv interpretiert werden.

INFORMATION

Allgemeines zur Globalstrahlung

Die Globalstrahlung ist die am Boden von einer horizontalen Ebene empfangene Sonnenstrahlung und setzt sich aus der direkten Strahlung (der Schatten werfenden Strahlung) und der gestreuten Sonnenstrahlung (diffuse Himmelsstrahlung) von der Himmelshalbkugel zusammen. Bei Sonnenhöhen von mehr als 50° besteht die Globalstrahlung zu ca. 3/4 aus direkter Sonnenstrahlung, bei tiefen Sonnenständen (bis etwa 10°) nur noch zu ca. 1/3.

98 % der Sonnenstrahlung, die am oberen Rand der Atmosphäre ankommt, entfallen auf den Wellenlängenbereich 0,29 µm bis 4,0 µm. Davon treffen 7 % als Ultraviolettstrahlung, 42 % im Bereich sichtbaren Lichts und 49 % als Infrarotstrahlung ein. Das Energiemaximum liegt bei 0,48 µm im grün-blauen Bereich des sichtbaren Lichtes. Der Mittelwert der Bestrahlungsstärke beträgt an der Obergrenze der Atmosphäre 1367 W/m² und variiert im Laufe des Jahres um ± 3,3 %.

Pyranometer

Beim Durchgang durch die Erdatmosphäre erfährt die Strahlung eine Abschwächung (Extinktion) durch Streuung an Luftmolekülen, durch Streuung, Absorption und Reflexion an Wolken- und Aerosolpartikeln, durch Absorption an Wasserdampf, Kohlendioxid, Ozon und anderen atmosphärischen Spurengasen. Die Extinktion hängt ab vom Sonnenstand, der atmosphärischen Trübung, der Dichte der atmosphärischen Medien und damit auch von der Höhe über dem Meeresspiegel.

Die Globalstrahlung wird mit dem horizontal justierten Pyranometer gemessen. Gegen Witterungseinflüsse wird der Messfühler durch zwei halbkugelförmige Glashauben geschützt. Die Messung der diffusen Sonnenstrahlung erfolgt ebenfalls mit einem Pyranometer, das zum Ausblenden der Sonne mit einem Schattenring ausgerüstet ist. Bei guter Wartung beträgt die Messgenauigkeit eines Pyranometers etwa ± 1%.
Die Messgeräte sind in der Regel horizontfrei aufgestellt.

Anwendungen zur Globalstrahlung

Bereitstellung von:

Messdaten	Der Deutsche Wetterdienst unterhält ein umfangreiches Archiv mit Strahlungsdaten. Die Daten können stationsbezogen in verschiedenen Formen bereitgestellt werden, z. B. als Stundenwerte, Tageswerte, Monatswerte, oder als mittlere monatliche Tagesgänge.
flächendeckenden Rasterdaten	Es ist aber auch möglich, flächendeckend im 1 km-Raster - also für jeden beliebigen Ort in Deutschland - mittlere und auch aktuelle Monatssummen der Globalstrahlung zu liefern.
Strahlungskarten	Auf der Basis der 1 km-Rasterdaten erstellt der Deutsche Wetterdienst Karten der Globalstrahlung für die Bundesrepublik Deutschland. Es gibt die Strahlungskarten für einzelne Monate, einzelne Jahre und für Mittelwerte über 20 Jahre hinweg - als Druckexemplare und auch online im WetterShop des DWD (**www.dwd-shop.de/klima**).
Ertragsgutachten	Die zunächst für die horizontale Fläche ermittelten Daten können auf beliebige Ausrichtungen und Neigungen umgerechnet werden. Mit der weiteren Kenntnis der technischen Kenngrößen einer geplanten Solaranlage kann der im Mittel zu erwartende Ertrag berechnet werden.

Nähere Informationen zur Globalstrahlung finden Sie unter www.dwd.de/globalstrahlung

INFORMATION

Gute Erholung - Der Kurortklimadienst des Deutschen Wetterdienstes

Wer zur Kur fährt, will sich erholen.
Und zur Erholung gehören – neben den therapeutischen Anwendungen – gute Luft und ein zuträgliches Klima. Luftqualität und klimatische Vorzüge sind für alle Kur- und Erholungsorte entscheidende Standortfaktoren. Nur wer nachweisen kann, dass die Luftqualität eine spürbare Entlastung für den Kur-Gast bedeutet, kann das Prädikat „Kurort" für die Kommune erwerben und erhalten. Und im Heilklimatischen Kurort ist das örtliche Klima sogar wesentlicher Bestandteil der Therapie.

Die meisten deutschen Kurorte wenden sich für diese Untersuchung an den DWD. Wir verfügen über die längste Erfahrung, das breiteste wissenschaftliche Fachwissen und die beste technische Ausstattung auf diesem Gebiet. Dadurch können wir eine hoch qualifizierte Beratung rund um die Erhaltung der Ressourcen Luft und Klima anbieten. Wir analysieren die Bedingungen vor Ort, erstellen Gutachten und machen Vorschläge. So unterstützen wir die Entscheider in den Kommunen sowie in den Kur- und Touristikbetrieben bei einer zukunftsfähigen Entwicklung ihrer Kurorte.

Der DWD bewertet die Luftqualität und die speziellen klimatischen Verhältnisse in Kurorten in einem Gutachten.

Diese werden nach den gesetzlichen Qualitätsstandards für Kurorte und Heilbäder erstellt. Sie dienen den zuständigen Behörden der Länder als Entscheidungshilfe für die Vergabe oder Bestätigung der Kurortprädikate. Als bundesweit tätige Fachbehörde garantieren wir unseren Kunden Objektivität und Neutralität – Gutachten des DWD sind allgemein anerkannte Untersuchungen, deren Aussage und Genauigkeit hohen Ansprüchen genügen.

Mit unseren Gutachten stellen wir den Kurorten ein wichtiges Instrument zur Qualitätssicherung ihres Kurangebots zur Verfügung. Anhand der Ergebnisse lassen sich Heilfaktoren des Klimas sowie Therapie- und Freizeitangebote optimieren. Für die Ansprache von Kurpatienten und Gesundheitstouristen enthalten die Gutachten wertvolle Argumentationshilfen.

Über solche Beratungen hinaus unterstützen wir die tägliche Gestaltung des Kurbetriebs mit unseren vielfältigen Vorhersageangeboten. Präzise lokale Wettervorhersagen sind für die Planung von Veranstaltungen ebenso wichtig wie für die Freizeitgestaltung der Kurgäste. Wir sagen den Pollenflug vorher, warnen vor Herz-Kreislauf belastenden Wetterlagen und geben Auskunft zur UV-Strahlung. Damit steht den Kurgästen ein lückenloses Informationsangebot zur Verfügung, das alle therapeutischen Maßnahmen unterstützen und ergänzen kann.

Der DWD ist seit Jahrzehnten im Bereich Wetter, Klima und Gesundheit tätig. Als Referenz für Meteorologie belegt der DWD im Kurortklimadienst und auf dem Gebiet der medizinmeteorologischen Forschung weltweit eine Spitzenposition.

Fragen beantworten wir Ihnen gerne!

Der Deutsche Wetterdienst - Referenz für Meteorologie

Ein Kurzporträt

Unser Auftrag
durch zuverlässige meteorologische Dienstleistungen Leben und Besitz vor wetterbedingten Gefahren zu schützen sowie die Allgemeinheit und die Wirtschaft zu unterstützen.

Unsere Leitlinie
Qualität, Zuverlässigkeit und Kundenorientierung

Unser Tätigkeitsspektrum

- Wetterüberwachung und -vorhersage rund um die Uhr
- Beratung und Information
- nationale und internationale Kooperation
- Forschung und Entwicklung

Unsere Fachaufgaben

- Vorhersage meteorologischer Entwicklungen
- Wetter-Warndienste für Träger öffentlicher Belange, die Wirtschaft und die Allgemeinheit
- Meteorologische Basisleistungen für die Bundeswehr
- Meteorologische Sicherung der Luft- und Seefahrt
- Überwachung der Atmosphäre auf radioaktive Spurenstoffe; Vorhersage der Verfrachtung
- Erfassung, Überwachung und Bewertung der meteorologischen Prozesse, Strukturen und Zusammensetzung der Atmosphäre sowie deren Wechselwirkung mit anderen Umweltbereichen
- Bereithaltung, Archivierung und Dokumentation meteorologischer Daten und Produkte
- Mitwirkung bei internationalen Projekten mit Schwerpunkt Europa

Personal:
2700 Beschäftigte

Arbeitsergebnisse:
Jährliche Produktion von 90.000 Vorhersagen und 14.500 Warnungen, 8.000 Beratungen/ Gutachten für insgesamt 30.000 Kunden sowie 436.000 Vorhersagen und 170.000 individuelle Beratungen für die Luftfahrt.

Flächenpräsenz:

- 173 Wetterstationen (davon 72 Automaten)
- ca. 2.900 Stationen mit ehrenamtlichen Beobachtern
- 1.450 phänologische Beobachtungsstellen
- 16 Wetterradarstandorte
- 2 Meteorologische Observatorien
- 9 aerologische Stationen
- 19 regionale Beratungsstellen

Groß-Rechner:
Rechenleistung von 2.9 Tera-FLOPS [Floating Point Operation per Second]

Hätten Sie gedacht, dass der DWD ein solches Spektrum an Dienstleistungen bietet? Und es sind noch viel mehr!
Besuchen Sie uns im Internet unter www.dwd.de
Erfahren Sie wie der Deutsche Wetterdienst seinem gesetzlichen Auftrag gerecht wird, Leben und Eigentum der Bürger sichern und schützen zu helfen.

INFORMATION

Leichte Brise aus Nordost oder Sturm aus Südwest?

Durch den Begriff "Wind" - griechisch: Anemos - wird ganz allgemein die Verlagerung von Luftteilchen in Bezug auf deren Richtung und Geschwindigkeit beschrieben. Der Wind ist somit eine typische Vektorgröße, da zu seiner vollständigen Beschreibung sowohl ein Betrag (Windgeschwindigkeit) als auch eine Richtung (Windrichtung) notwendig ist.

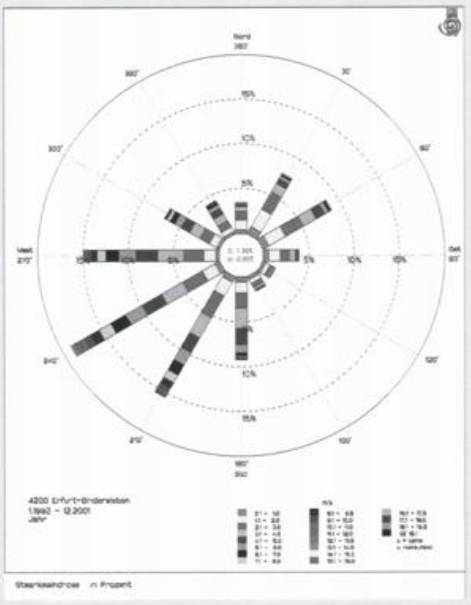

Physikalisch ist die Windgeschwindigkeit ein Maß für den von bewegten Luftteilchen je Zeiteinheit zurückgelegten Weg (Windweg); sie wird überwiegend in m/s, km/h oder Knoten (kn) angegeben: 1 m/s = 3.6 km/h oder 1 kn = 1 Seemeile (sm)/h = 1.852 km/h

Die Windrichtung ist die Himmelsrichtung aus der der Wind weht. Sie wird nach dem Polarwinkel (Azimut) bestimmt und in Grad angegeben. Je nach Anwendungsgebiet werden die Himmelsrichtungen unterschiedlich genau eingeteilt. In einem Horizontalkreis sind Teilungen von 8, 16, 32 oder 36 Richtungen möglich.

Sie möchten nun für Ihren Standort die vorherrschende Windrichtung und -geschwindigkeit wissen?

Von ca. 230 Stationen des DWD wurden die stündlichen Daten der Windrichtung und der Windgeschwindigkeit aus den 10 Jahren 1991 bis 2000 statistisch bearbeitet. Diese Daten wurden so aufbereitet, dass für jede Messstation angegeben wird, wie häufig der Wind aus den einzelnen Richtungen mit bestimmten Geschwindigkeiten weht. Diese Statistik wird grafisch als Windrose dargestellt. Eine Windrose gibt die mittleren Windverhältnisse an einer Messstelle in einer Höhe von 10 m über dem Erdboden - idealerweise in freiem, offenem Gelände - wieder.

Weitere statistische Auswertungen -
wie z.B. Zahlenwerte zur Windrose, andere Zeiträume, andere Windrichtungs- bzw. geschwindigkeitsbereiche, usw. -
erstellen wir Ihnen gerne auf Anfrage.

INFORMATION

Klima und Klimatechnik verbinden? TRY! Die Neuen Testreferenzjahre für Deutschland.

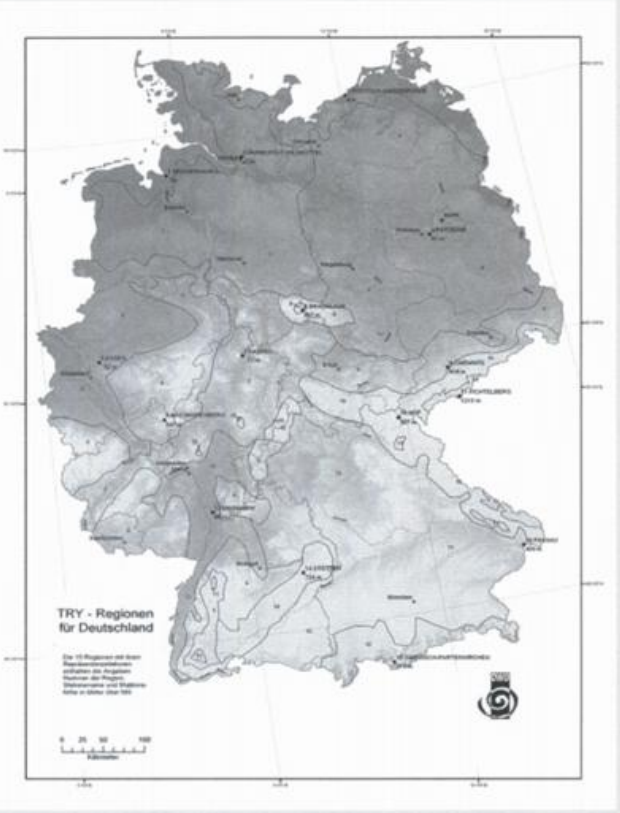

Ist eine Klimaanlage im Gebäude notwendig? Wird für ausreichende Gebäudebelüftung gesorgt? Werden Raumtemperaturen eingehalten - im Sommer wie im Winter? Welche Dimensionen müssen Heizungsanlagen haben? Ist eine Glasfassade nach Süden hin sinnvoll?

Ihre Entscheidungen werden leichter und sicherer mit den Testreferenzjahren des Deutschen Wetterdienstes (DWD) - der nationalen Referenz für Meteorologie.

Testreferenzjahre (TRY) liefern die klimatischen Randbedingungen für ingenieur-technische Planungen und Simulationsrechnungen auf stündlicher Basis. Diese werden insbesondere für raumluft- und heiztechnische Anlagen durchgeführt, aber auch für Anwendungen anderer technischer und nicht-technischer Systeme.

Typisch für das Klima der Region

Der DWD gliedert die Bundesrepublik Deutschland in 15 TRY-Regionen. Basis dafür sind die Ergebnisse einer Faktoren- und Clusteranalyse. Für jede TRY-Region bestimmten unsere Wissenschaftler eine Referenzstation, und aus den Messwerten dieser Referenzstation erstellten sie ein mittleres Testreferenzjahr. Dieser Datensatz enthält zahlreiche meteorologische Elemente für jede Stunde eines Jahres.

Ein TRY bildet für ein repräsentatives Jahr den charakteristischen Witterungsverlauf ab, der auf einer Analyse der Großwetterlagen basiert. Dabei werden einzelne Witterungsabschnitte so ausgewählt, dass die Jahreszeitenmittelwerte (insbesondere Lufttemperatur und -feuchte) möglichst gut mit den 30-jährigen Mittelwerten übereinstimmen.

Zusätzlich erstellte der DWD für jede Referenzstation einen Extremwert-Datensatz für einen kalten Winter (Dezember bis Februar) und einen Extremwert-Datensatz für einen heißen Sommer (Juni bis August).

Die Qualitäten der neuen TRY

Erstmals stehen jetzt TRY-Datensätze für die neuen Bundesländer und somit für ganz Deutschland zur Verfügung.

Der Bezugszeitraum wurde aktualisiert und entspricht der international vereinbarten Referenzperiode (1961 bis 1990) der World Meteorological Organisation (WMO).

Die Auswahl der meteorologischen Parameter passte der DWD den Bedürfnissen der Heizungs-Klima-Lüftungstechnik an und erfüllt damit die Anforderungen der DIN 4710 (Fassung vom Januar 2003).

Die Qualität der Strahlungsdaten wurde deutlich verbessert, indem die bisherigen Modelldaten überwiegend durch Messwerte ersetzt werden.

Es stehen jetzt auch Extremwert-Datensätze zur Verfügung.

Die TRY sind komplett, praktisch und günstig.

In der Veröffentlichung "Testreferenzjahre von Deutschland - für mittlere und extreme Witterungsverhältnisse TRY" finden Sie eine ausführliche Beschreibung, sowie die TRY-Datensätze aller Regionen auf einer CD.

3) **Abweichung** *vom vieljährigen Mittel (1961-1990)*
Kein Wert bedeutet kein Mittelwert vorhanden.
4) **K** = *Kelvin (1 Kelvin ≙ 1°C)*
5) **MAX** = *Maximum*
6) **MIN** = *Minimum*
7) **MIN am Erdboden** = *(5cm über Grund) Tiefstwert in der Zeitspanne von 01.00 Uhr bis 01.00 Uhr MEZ des Folgetages*
8) **Sommertag** = *Temperaturmaximum 25,0° C und höher*
9) **Heißer Tag** = *Temperaturmaximum 30,0° C und höher*
10) **Frosttag** = *Temperaturminimum unter 0° C*

Kompetenz für die Agrarwirtschaft

Wenn Landwirte, Winzer und Gärtner ihre tägliche Arbeit planen, dann dreht sich fast alles um die eine zentrale Frage: Wie wird das Wetter?
Auch wenn das Wettergeschehen oft überraschende, unvorhergesehene Wendungen nimmt - kein Landwirt, kein Winzer und kein Gärtner ist dem Wetter heute mehr unvorbereitet ausgeliefert. Präzise Prognosen und detaillierte meteorologische Informationen machen auch in den stark wetterabhängigen Branchen den Arbeitsalltag planbar und den Erfolg kalkulierbar.

Die Abteilung Agrarmeteorologie des Deutschen Wetterdienstes bietet den Landwirten, Winzern und Gärtnern ein leistungsstarkes Beratungsprogramm, das umfassend über das Wetter und seine Auswirkungen auf den pflanzlichen Anbau informiert. Wir helfen Ihnen, den optimalen Zeitpunkt für die Aussaat zu bestimmen, den Düngemitteleinsatz zu reduzieren oder die Ernte noch rechtzeitig einzubringen. Punktgenaue Vorhersagen für das Wetter auf Ihrem Betrieb haben wir genauso anzubieten, wie mittelfristige Prognosen für die ganze Region. Für Sie, die Landwirte, Winzer und Gärtner, haben wir einen ganzen Katalog von Dienstleistungen aufgebaut, mit denen wir Sie, gerne auch täglich, aktuell auf dem neuesten Stand des Wetters halten.

Wir rechnen mit dem Wetter:
Als Grundlage für die Beratung hat der DWD nach langjährigen Forschungsarbeiten ein agrarmeteorologisches, computergestütztes Beratungsprogramm entwickelt. Aufgrund der Vorhersagen können zusätzlich physikalische und biologische Vorgänge im Boden und im Bestand ermittelt werden. High-Tech-Leistung, die nur ein Ziel hat: Dass Sie den richtigen Zeitpunkt für alle Ihre Maßnahmen treffen. So können Sie Erfolg, Erträge und Wirtschaftlichkeit Ihres Betriebes spürbar steigern.

Landschaft kann verändert werden:
Durch Baumaßnahmen zum Beispiel oder durch landbauliche Eingriffe.
Was genau passiert, wenn die Landschaft verändert wird, darauf geben die agrarmeteorologischen Gutachten des DWD kompetent und detailliert Antwort. Unsere Gutachter geben der Agrarwirtschaft wertvolle Unterstützung bei Investitionsplanungen und Standortentscheidungen. Und sie bieten auch Landschaftsplanern und politischen Entscheidungsträgern Basisbausteine für eine erfolgreiche Arbeit an:
Handlungsfähigkeit durch unsere qualifizierte Information.

Ein neuer Tag.
Was bringt das Wetter heute?
Genauer weiß es das Wetterfax für die Landwirtschaft. Oder das Wettertelefon. Hier erhalten Sie täglich aktualisierte und agrarspezifische Wetterprognosen für die nächsten 5 bis 7 Tage auf Ihre jeweilige Region abgestimmt. Jahreszeitlich bieten wir unterschiedliche Dienstleistungen an: Sommer-Wetterfax, Weinbaufax und schließlich noch das Winter-Wetterfax.
In der von Ihnen abonnierten Zeit können Sie das Fax abrufen, so oft Sie es wünschen.

Natürlich finden Sie Landwirtschaftswetter auch im Internet. Die Prognoseseiten von **www.agrowetter.de** bieten Wochenvorhersagen für mehr als 300 Wetterstationen in Deutschland. 4 mal täglich aktualisiert - so sind Sie immer auf dem neuesten Stand.

Fragen Sie uns - wir beraten Sie gerne:
069 - 8062 4408 oder im Internet: www.agrowetter.de
oder mailen Sie uns an: agrarmeteorologie@dwd.de

Sonnenbrand, UV-Index und stratosphärisches Ozon

Sonnenstrahlen - nach einem langen Winter ist die Sonne des Frühlings und Sommers ein besonderer Genuss. Sie regt die Stimmung an und fördert das Wohlbefinden. Jeder von uns kennt das!

Durch ihre ultraviolette Komponente, das UV-Licht, wird in unserer Haut das für den Knochenaufbau und -erhalt wichtige Vitamin D gebildet. Jedoch reichen dazu schon wenige Minuten Bestrahlung von Handrücken und Gesicht aus. Das solare UV birgt auch Gefahren. Der Effekt übermäßiger UV-Exposition - der Sonnenbrand - wird erst nach Stunden, dann aber schmerzhaft spürbar. Wie weltweit, nimmt auch in Deutschland die Zahl der jährlichen Neuerkrankungen an Hautkrebs stark zu (fast ein Drittel aller Krebsfälle). Dies rührt vor allem von der weitverbreiteten Einstellung her, dass eine sportliche Bräune wünschenswert und ein Zeichen für Gesundheit sei.

Das, die Erdoberfläche erreichende, kurzwellige UV-B (< 320 nm) wird wesentlich von der Mächtigkeit der Ozonschicht in 15 bis 30 km Höhe bestimmt. Sie schirmt ca. 90% des biologisch besonders wirksamen UV-B ab (siehe Abb.1). Das Risiko zu hoher UV-Werte wird durch die Ausdünnung dieses Ozongürtels zusätzlich gesteigert.

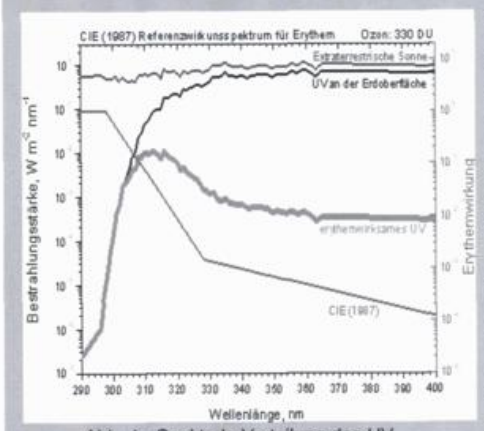

Abb. 1: Spektrale Verteilung des UV

Die Messungen am Meteorologischen Observatorium Hohenpeißenberg belegen eine Ausdünnung der Ozonschicht auch für Deutschland. Die Zahl der Tage mit starken Abweichungen gegenüber den langjährigen Werten hat in den letzten drei Jahrzehnten signifikant zugenommen. Sie konzentrieren sich auf die erste Jahreshälfte; das Gesamtozon kann dann um bis zu 25% gegenüber dem klimatologischen Mittel vermindert und dadurch das UV-B am Erdboden um bis zu 30% verstärkt sein.

Als ein Element der Vorsorge haben die Weltorganisationen für Gesundheit (WHO) und für Meteorologie (WMO) den UV-Index eingeführt. Der UV-Index ist ein Maß für die Stärke der potenziell schädigenden UV-Strahlung. Er wertet die wellenlängenabhängige Wirksamkeit des UV für Sonnenbrand, [griech. Erythem] (CIE-Kurve Abb. 1), in einer einzigen dimensionslosen Zahl. Der UV-Index wird neben dem Ozon vom Sonnenstand, also von geographischer Breite, Tages- und Jahreszeit und von der Bewölkung bestimmt. In Deutschland liegen Anfang Juli die höchsten Werte bei 8, in den Bergen auch darüber. In den Tropen und Subtropen werden Werte über 12 erreicht. Der UV-Index ist vom Hauttyp unabhängig und für alle gleichermaßen aussagekräftig.

Zur Vorbeugung braucht es die Vorhersage. Der europäische Satellit ENVISAT misst täglich, global deckend, das Ozon. Auf dieser Grundlage errechnen wir Änderungen in der Ozonschicht sehr präzise. Darauf aufbauend wird der UV-Index ermittelt. Er berücksichtigt die strahlungsmindernde Wirkung von Wolken, genauso wie die verstärkenden Effekte von Seehöhe und Schnee. Entsprechend den Empfehlungen der WHO wird das Tagesmaximum des UV-Index veröffentlicht (siehe Abb.2).
Die beste Vorsorge ist stets ein aktiver und vorbeugender Sonnenschutz. Lockere Kleidung, ein breitkrempiger Hut, eine gute Sonnenbrille, Hautcremes mit hohem Lichtschutzfaktor und natürlich Schatten sind der beste Schutz - und machen Aktivitäten im Freien wirklich gesund.
Die **UV-Warnungen des Deutschen Wetterdienstes** machen es Ihnen leicht, an den notwendigen UV-Schutz zu denken. Informationen finden Sie im Internet unter: **www.uv-index.de** **global: www.dwd.de/PROMOTE** **www.wettergefahren.de**

WITTERUNG

NIEDERSCHLAG

Dez. 03 bis Feb. 04

Winter*

Zwar fehlten in diesem Winter die Südwestlagen (normal 7%), doch bei häufiger südwestlicher Anströmung in den vorherrschenden Westlagen gerieten der Dezember (14%) und der Januar (13%) zu warm, der Dezember infolge der Hochdruckhäufigkeit (8%) auch sehr sonnig. Die 3% Südlagen - nur im Dezember - waren gegen normal 7% zu selten, führten aber zu extremen Temperaturmaxima Anfang des Monats. Auch der Februar war trotz häufiger Nordlagen (16%) und trotz der Ostlagen, die nur in diesem Monat auftraten (3%), ein zu warmer Monat. Etwas winterliche Kälte brachten die Nordlagen des Dezember (9%) und des Januar (7%), die insgesamt normal häufigen Nordwestlagen des Januar (4%) und des Februar (3%) sowie die häufigeren Hochdrucklagen im Dezember (8%) und im Januar(10%). Die zyklonal geprägten Lagen (66%) dominierten deutlich über die antizyklonalen (34%).

Das gesamtdeutsche **Gebietsmittel** von 201 mm betrug 114 % des vieljährigen Mittels. In allen Bundesländern lag es über 95 %. Am besten versorgt war Niedersachsen (137 %). Das außer in Niedersachsen/Bremen vorhandene Defizit des Dezember (Baden-W. bis -47 %, landesweit -24 %) wurde im Januar wieder aufgeholt (Thüringen +28 % bis Südbayern +119 %). Es folgte ein normaler Februar (gesamt 105 %) mit unterschiedlicher räumlicher Verteilung: Überschuss im Norden (bis +88 % Schleswig-H.), Defizit im Süden (-2 % Sachsen bis -49 % Baden-W.). Weniger als **100 mm** fielen in Oderbruch und Thüringer Becken, mehr als **200 mm** verbreitet im westlichen Norddeutschen Tiefland, in vielen Mittelgebirgen, teils im Alpenvorland und in den Alpen. Mehr als **300 mm** hatten Oldenburg i.O., die hohen Mittelgebirge und der größte Teil der Alpen; mehr als **500 mm** Oberharz und Alpengipfel. **Einzelwerte**: 66 mm (Erfurt) bis 636 (Brocken) bzw. 640 mm (Zugspitze). **Abweichungen**: -51 % (Michelstadt-V.) bzw. -43 (Erfurt) bis +65 (Helgoland) bzw. +75 % (Oldenbg. i.O.)

März 04 bis Mai 04

Frühling*

Wie im Vorjahr waren die Hochdrucklagen mit 37 % aller Tage häufiger als normal (25 %). Sie hatten in jedem Monat Anteile von 11 % bis 14 %. Warme und meist feuchte Luftmassen gelangten im März und April häufig in unseren Raum: bei Ostlagen (März 4%, April 3 %), bei den diesmal seltenen Westlagen (9 % nur im März, gegen 20 % im Mittel), und bei den häufigen Südlagen (10 % nur im April, gegen 12 % im Mittel). Während Nordlagen im März (6 %) strömte sogar warme Mittelmeerluft heran, nur im April (9 %) kam dabei polare Meeresluft an. So lagen Monatsmitteltemperaturen und Sonnenscheinstunden im März und April über dem Durchschnitt. Im Mai trugen Nordwestlagen (10 % gegen 3 % im Mittel) und Tiefdruckgebiete über Mitteleuropa (5 % gegen 4 % im Mittel) zu unternormalen Monatsmitteltemperaturen bei. Die Anteile zyklonaler und antizyklonaler Wetterlagen waren gleich groß.

Das **Gebietsmittel** lag mit 142 mm bei 78 % des vieljährigen Wertes. In Thüringen/Sachsen wurden 100 % erreicht, in Baden-W. 66 %. Die Defizite im März (-38 %) und April (-33 %) wurden im Mai mit fast normalen Werten etwas aufgeholt. Im März war die Hälfte der Länder unterversorgt (über -40 %). Auch im April ergaben sich geringe Werte (-54 % Sachsen bis -10 % NRW). Im Mai wurde Überschuss in Sachsen (+65 %), Thüringen (+63 %), Hessen (+29 %) und Nordbayern (+13 %) errechnet. Weniger als **100 mm** fielen nordwestlich Kiel-Bremen-Emden, auf Fehmarn, Rügen, von Wendland-Magdeburg bis zur Oder, in Wittenberg, Düsseldorf, Mannheim, Stuttgart und Straubing. Mehr als **200 mm** gab es in höheren Mittelgebirgen östlich des Rhein und im Alpenbereich. Über **300 mm** hatten Brocken, Fichtelberg/Erzgeb. und die Alpenhochlagen. **Einzelwerte**: 51 (Norderney) bzw. 56 mm (Helgoland) bis 334 (Fichtelberg) bzw. 474 (Wendelstein) und 486 mm (Zugspitze). **Abweichungen**: -64 % (Norderney) bzw. -55 (Freiburg i.Br.) bis +42 (Chemnitz) bzw. +47 % (Erfurt).

Juni 04 bis Aug. 04

Sommer*

Es dominierten die zyklonalen Westlagen mit 35 % aller Tage gegenüber normal 26 %. Sie brachten im Juni (14 %) und August (16 %) kühle und unbeständige Witterung. Von gleicher Wirkung waren zyklonale Südwestlagen im Juli (9 %) und August (5 %), Nordlagen im Juni (6 %) und Juli (12 %), eine zyklonale Nordwestlage im Juni (7 %) und eine Südlage (5 %) im Juli. Außer den Südwestlagen (14 % gegen 5 % im Mittel) traten diese Wetterlagen normal häufig auf. Es fehlte die ausreichende Zahl der Tage mit Hochdrucklagen (normal 16 %). Diese kamen nur einige Tage im Juni (5 %) vor. So ergaben sich insgesamt der zu kalte Juni und Juli. Im August erreichten die Temperaturen bei einer längeren Ostlage (12 %) noch hochsommerliche Werte und eine übernormale Monatsbilanz. Die Häufigkeit der zyklonalen Wetterlagen übertraf mit 79 % die der antizyklonalen mit 21 % sehr deutlich.

Das **Gebietsmittel** von 258 mm lag 12 % über dem vieljährigen Mittel, am meisten in Schleswig-H. (+36 %). Defizitär war Südbayern (-20 %). Der negative Juni wurde im Juli (+35 %) und August (+20 %) ausgeglichen. Zwischen Norden und Süden gab es große Unterschiede: Juni von -41 (Baden-W.) bis +55 % (Schleswig-H.), Juli von -8 (Südbayern) bis +81 (Brandenbg./Berlin), August von -38 (Südbayern) bis +30 % (Mecklenbg.V.). Weniger als **200 mm** fielen auf Sylt, von Rostock bis Stralsund, im Wendland, verbreitet zwischen Bernburg-Angermünde und Eisenach-Hof-Görlitz, in der Pfalz, um Gießen, vom mittleren Neckar bis Nürnberg und im Raum Regensburg-Augsburg-Straubing; mehr als **300 mm** oft im Norden Schleswig-Holsteins, auf Norderney, in Bremerhaven, vielen Mittelgebirgen, Aachen, Breisgau und Alpenbereich; über **500** in Südschwarzwald, Alpen. **Einzelwerte**: 149 (Erfurt) bzw. 151 mm (Augsbg.) bis 544 (Feldbg./Schw.) bzw. 622 (Oberstdf.) und 659 mm (Zugsp.). **Abweichungen:**-47 % (Augsbg.) bzw. -38 (Straubing) und -29 (Öhringen) bis +69 (Leipzig) bzw. +71 (Norderney) und +75 % (St.Peter-O./Eiderstedt).

Sept.04 bis Nov. 04

Herbst*

Am häufigsten traten die Hochdrucklagen an 24 % der Tage auf (normal 20 %), sie waren auf September und November gleichmäßig verteilt. Es folgten 21 % West- und 18 % Südwestlagen, die jeweils im September (12 %) und Oktober (18 %) dominierten. Normal sind 30 % Westlagen und 9 % Südwestlagen. Trotz fehlender Südlagen mit Warmluftzufuhr (normal 12 %), einem zu geringen Anteil Ostlagen (nur im Oktober 7 %, gegen insgesamt 9 % normal) und trotz häufiger Nordlagen in allen Monaten (22 % gegen 12 % normal) mit Zufuhr von Meeresluft war in den meisten Landesteilen die Mitteltemperatur aller Monate übernormal. Auch die Sonnenscheinstunden lagen im September und Oktober über dem Durchschnitt. 58 % der Wetterlagen waren zyklonal, 42 % antizyklonal geprägt.

Das **Gebietsmittel** von 184 mm lag nur 2 % über dem vieljährigen Mittelwert. Am trockensten war Rheinland-Pfalz/Saarland (-20 %), am feuchtesten Sachsen (+28 %). Jeder Monat hatte eine fast normale Gesamtbilanz, jedoch waren die Länder-Anteile unterschiedlich. Im September gab es Überschuss bis +33 % in Sachsen-Anhalt und Defizite bis -34 % (Brandenburg/Berlin), im Oktober +84 % in Baden-Württemberg bis -53 % in Sachsen-Anhalt, im November erhielt Sachsen +105 %, Baden-W. -44 %. Weniger als **100 mm** fielen an der Oder, vom Wendland über die Magdeburger Börde bis zum Thüringer Becken und im Rheingau. Mehr als **300 mm** gab es um Cuxhaven, in Rothaargebirge, Harz, Schwarzwald und Bayerischem Wald, örtlich in Erzgebirge und Thüringer Wald sowie verbreitet in den Alpen. **Einzelwerte:** 82 mm (Artern/Thüringen) bzw. 91 mm (Angermünde) bis 406 mm (Großer Arber/Bayerischer Wald) bzw. 413 mm (Zugspitze), Brocken/Harz 423 mm. **Abweichungen:** -37 % (Trier-Petrisbg.) und -35 % (Berus/Saarland) bzw. -29 % (Oberstdorf) bis +45 % (Lahr) bzw. +53 % (Chemnitz), Fichtelberg/Erzgebirge +64 %.

* Die Prozentzahlen beziehen sich auf alle 91 bzw. 92 Tage der betreffenden Jahreszeit.

TEMPERATUR

SONNE

Die **Tagesmittel** waren meist positiv; mehr als 2°C gab es verbreitet im Norddeutschen Tiefland westlich von Stralsund-Wernigerode, an Mittelrhein, Mosel, Lahn, Untermain und unterem Neckar, in Wetterau und Oberrheingraben (Düsseldorf 4.1°C, Helgoland 4.3°C). Negative Werte hatten die höheren Mittelgebirge und Südostbayern (Großer Arber/Bayerischer Wald -4.6°C, Zugspitze -10.9°C). Damit war der Winter auf Gr. Arber, Zugspitze und Wendelstein 0.3 K zu kalt, sonst bis 1.8 K zu warm (Oldenburg i.O., Artern/Thüringen, Bendorf/Rhein). Die **Höchstwerte** traten vom 01. - 05.12. mit 15 % und vom 03. - 06.02. mit 85 % auf. Davon waren der 04.02. mit 25 % und der 06.02. mit 34 % die Schwerpunkte. Sie reichten von 2.9°C (Zugspitze 04.12.) und 9.6°C (List/Sylt 05.12.) bis 18.6°C (Garmisch-P. 02.12.) und 18.8°C (Stuttgart/Schnarrenbg. 06.02.). Die **Tiefstwerte** bewegten sich von -25.9°C (Zugspitze 23.12.) bzw. -21.4°C (Oberstdorf 24.12.) bis -2.8°C (Helgoland 27.01.). Sie traten im Dezember mit 23 %, im Januar mit 69 %, im Februar mit 8 % auf. Die Schwerpunkte lagen im Januar: 01. - 06. mit 44 % und 21.- 27. mit 25 %.

Die **Sonnenscheindauer** reichte von 118 Stunden (Lüdenscheid) und 119 (Bad Kissingen) bzw. 121 (Menz-Neuglobsow/Brandenbg.) und 124 Std.(Osnabrück) bis 264 (Wendelstein) bzw. 329 Std. (Zugspitze). Unter 150 gab es verbreitet zwischen Aachen-Schleswig und Saarland-Eisenach-Oderhaff, in Elbsandsteingebirge und Thüringer Wald, in Teilen von Harz und Erzgebirge sowie an der Fränkischen Saale. Über 200 Std. wurden oft in Berlin, in Teilen von Südostbrandenburg und verbreitet südlich von Mainz-Passau registriert. Mehr als 250 Std. hatten Feldberg/Schw., Klippeneck/Schwäb. Alb, Hohenpeißenberg und die Alpenhochlagen. Sonst waren es 150 bis 200 Stunden. Damit lag das Sonnenscheinangebot verbreitet bis 36 (Artern/Thüringen,Straubing,Karlsruhe) bzw. 47 % (Konstanz,Lahr) über dem Durchschnitt; in Schwarzwald und Alpenraum, vom Bayerischen Wald über das Vogtland bis Görlitz, in Mittelgebirgen nördlich Main-Nahe, vom Niederrhein bis zur Mittelweser und örtlich im Norddeutschen Tiefland wurde es bis 21 % (Fichtelbg./Erzgeb.) und 25 (Gr. Arber/Bayr. W.) bzw. 28 % (Lüdenscheid) unterschritten.

Die **Tagesmittel** lagen meist unter 10°C; weniger als 8°C gab es auf Rügen und Helgoland, im Norden Schleswig-Holsteins, verbreitet in den Mittelgebirgen, am Nordrand von Erzgebirge-Thüringer Wald und verbreitet südlich der Donau, wobei weniger als 6°C die Hochlagen der Mittelgebirge (2.0°C Brocken, Fichtelberg; 1.5°C Gr. Arber) und die Alpen hatten (0.3°C Wendelstein, -7.0°C Zugspitze). Mehr als 10°C waren es am Oberrhein (Freiburg i.Br. 11.1°C). Es war in der Ortenau und in Teilen Südbayerns bis 0.2 K (Lahr, z.B.: Oberstdorf, Straubing), in Bad Hersfeld 0.3 K zu kalt; sonst bis 1.5 (Westermarkelsdorf/Fehmarn) bzw. 1.7 K zu warm (Rostock-Warnemünde). Die **Höchstwerte** traten zu 25% im April und zu 75% im Mai auf, wobei die Schwerpunkte vom 18.-20.05. mit 26% und vom 29.-31.05. mit 43% waren. Sie lagen zwischen 6.4 °C (Zugspitze 22.04.) bzw. 14.4°C (Wendelstein 14.04.) und 28.8°C (Freiburg i.Br. 20.05.). Die **Tiefstwerte** von -22.6 (Zugspitze 01.03.) bzw. -15.4°C (Oberstdorf 02.03.) bis -0.9°C (Helgoland 05.03.) gab es nur im März, sie traten zu 83 % vom 01.-06., zu 10 % vom 08.-10., zu 6 % am 27./28. auf.

Die **Sonnenscheindauer** schien 364 Stunden (Brocken/Harz) bzw. 367 Std. (Gr. Arber/Bayr. W.) bis 616 Std. (Lahr) bzw. 671 Std. (Arkona/Rügen). Weniger als 440 Stunden waren es bei Paderborn, im Harz, örtlich in Thüringer Wald und Erzgebirge sowie im Bayerischen Wald. Mehr als 500 Stunden gab es verbreitet nördlich von Oldenburg i.O.-Lübeck-Görlitz, im Raum Leipziger Bucht-Thüringer Becken, bei Köln und verbreitet südlich von Bitburg/Eifel-Marburg-Bayreuth-Passau, wobei sich auf Fehmarn und Rügen, in Teilen vom Oberrheingraben und am Bodensee mehr als 600 Stunden ergaben. Sonst wurden 400 bis 500 Stunden registriert. Damit lag das Sonnenscheinangebot meist bis 24 % (Karlsruhe) bzw. 25 % (Konstanz) und 26 % (Lahr) über dem Durchschnitt; auf Sylt, um Cuxhaven, gebietsweise zwischen Oderhaff-Hosteinische Schweiz-Bocholt und Düsseldorf-Edersee-Würzburg-Fichtelgebirge sowie im Bayerischen Wald wurde es bis 12 % (Bad Lippspringe, Neuhaus am Rennweg/Thüringer Wald) bzw. 18 % unterschritten (Gr. Arber).

Die **Tagesmittel** lagen über 18°C in Teilen von Berlin, am Main (unterhalb Schweinfurt), im Rhein-Main-Gebiet, am Neckar (unterhalb Tübingen), an Hoch- und Oberrhein (Freiburg i.Br. 20.0 °C), am Bodensee und in München. Unter 16°C waren es auf Rügen, in Teilen Schleswig-Holsteins, in den meisten Mittelgebirgen und im Alpenbereich, wobei weniger als 14°C die höchsten Mittelgebirge (Brocken 10.4°C) und die Alpenhochlagen hatten (Wendelstein 9.3°C, Zugspitze 2.0°C). Damit war der Sommer nur in Boltenhagen um 0.1 K und in Bad Hersfeld um 0.2 K zu kalt, sonst bis1.3 K zu warm (Stuttgart/Schnarrenbg.).Die **Höchstwerte** wurden zu 88 % im August registriert, sie traten auf vom 05. - 07.08. mit 25 % und vom 09. - 12.08. mit 59 %, dabei meldeten 31 % der Stationen am 12.08. ihre höchste Temperatur. Sie lag zwischen 13.6°C (Zugspitze 10.08.) und 34.5°C (Karlsruhe 05.08.). Die **Tiefstwerte** reichten von -6.5°C (Zugspitze 21.06.) bzw. 0.0 (Wendelstein 06.06.) bis 9.1°C (Norderney 20.06.) bzw. 10.6°C (Freiburg 06.06.). Sie traten zu 93 % im Juni, zu 6 % im August und zu 1 % im Juli auf. Der Schwerpunkt war mit 73 % vom 14. - 21.06., wobei 55 % der Orte am 20.06. ihren Tiefstwert hatten.

Die **Sonnenscheindauer** reichte von 431 Stunden (Großer Arber/Bayerischer Wald) bzw. 459 Std. (Brocken/Harz) und 463 Std. (Zugspitze) bis 696 Std. (Helgoland) bzw. 702 Std. (München/Flgh.) und 727 Std. (Westermarkelsdorf/Fehmarn). Weniger als 500 Stunden waren es örtlich im Norden von Brandenburg, auf dem Brocken, auf dem Kahlen Asten/Rothaargebirge, örtlich im Thüringer Wald, im Bayerischen Wald und in den Hochlagen der Alpen. Mehr als 600 Stunden gab es abschnittsweise an den Küsten, von Vorpommern bis zum Oderbruch, verbreitet zwischen Eberswalde-Hannover und Bautzen-Zwickau-Eisenach, in Gießen und Weiden sowie verbreitet zwischen Bitburg/Eifel-Coburg-Passau und Alpenrand. Sonst wurden 500 bis 600 Stunden registriert. Damit lag das Sonnenscheinangebot überwiegend 24 % (Menz-Neuglobsow/Brandenburg) bzw. 28 % (Gr. Arber/Bayr. W.) unter dem Durchschnitt; örtlich an der Nordsee sowie gebietsweise am Nordrand der Mittelgebirge und südlich von Main-Nahe um 8 % (München/Flgh.) bzw. 12 % (Chemnitz) und 13 % (Braunschweig) über dem Durchschnitt.

Die **Tagesmittel** lagen über 10°C verbreitet nordwestlich von Stralsund-Hamburg-Wolfsburg (Helgoland 11.9°C), auf Rügen, in Teilen von Berlin, am Rhein (Karlsruhe 11.4, Freiburg 12.2°C) und am Unterlauf der Nebenflüsse, in Trier und München sowie am Bodensee. Weniger als 8°C waren es in den höchsten Mittelgebirgen und im Alpenbereich. Weniger als 6°C hatten Gipfel in Südschwarzwald, Harz (Brocken 4.1), Thüringer Wald, Erzgebirge (Fichtelbg. 4.1), Bayerischem Wald und die Hochlagen der Alpen (Wendelst. 4.1, Zugspitze -2.6°C). In Bad Hersfeld ergab sich das vieljährige Mittel, sonst war es bis 1.4K zu warm (München/Flgh.). Die **Höchstwerte** gab es zu 96 % im September: 89 % vom 03.-07.(35 % am 04.), 7 % am 10./11. (meist Südwesten); am 05. Oktober: Greifswald, Cottbus, Wendelstein, Lahr. Sie lagen zwischen 12.6°C (Zugspitze 07.09.) bzw. 17.7 (Gr.Arber/Bayr.W. 03.09.) und 29.2°C (Karlsruhe 04.09., Konstanz 05.09.) bzw. 29.7°C (Freiburg 05.09.). Die **Tiefstwerte** von -20.5°C (Zugsp. 20.) bzw. -11.9 (Wendelst. 20.) bis 1.0°C (Westermarkelsdf./ Fehmarn 09.) bzw. 2.2°C (Helgoland 19.) gab es nur im November: 24.-26. (62 %), 19.-21. (25 %), 14.-16. (11 %), 09. Köln, Fehmarn.

Die **Sonnenscheindauer** bewegte sich von 268 Stunden (Tholey/ Saarland) und 275 Std. (Kahler Asten/Rothaargebirge) bzw. 283 Std. (Freiburg i.Br.) bis 402 Std. (Erfurt) und 403 Std. (Aachen) bzw. 411 Std. (Braunschweig), Zugspitze 432 Stunden. 350 Stunden und mehr gab es nördlich der Mittelgebirge nahezu überall (Westermarkelsdf./ Fehmarn 399 Std.), örtlich an Lahn und Werra, von der Oberpfalz entlang des Main bis Rheingau-Pfälzer Wald und südöstlich von Kempten-Straubing. Sonst waren es weniger als 350 Stunden, wobei örtlich in Thüringer Wald und Saarland, im Gebiet Südschwarzwald-Breisgau und um Ulm weniger als 300 Stunden registriert wurden. Damit lag das Sonnenscheinangebot örtlich in Erzgebirge, Thüringer Wald und Rothaargebirge, verbreitet zwischen Oberrhein und Mosel, im Raum Passau-Bayerischer Wald und südwestlich Karlsruhe-Erlangen-Chiemsee überwiegend bis 23 % (Freiburg i.Br.) bzw. 25 % (Feldberg/Schw.) und auf dem Klippeneck/Schwäbische Alb 28 % unter dem Durchschnitt, sonst bis 32 % (St.Peter-Ording/Eiderstedt) bzw. 34 % (Artern/Thüringen), in Braunschweig 38 % über dem Durchschnitt, wobei die meisten Bereiche bis +25 % hatten.

BESONDERE WETTERERSCHEINUNGEN und -SCHÄDEN

Temperatursprünge (bezüglich des Maximums):
Herausragende Anstiege (>=10.0 K) waren selten; maximal im Dezember 14.2 K in Garmisch-Partenkirchen (22. auf 23.), im November 11.2 K in Konstanz (21. auf 22.); sonst nur noch im Januar und Juli.
Herausragende Rückgänge (>=10.0 K) gab es fast in jedem Monat: allgemein bis 11.5 K, aber maximal im Mai 13.0 K in Fürstenzell/Niederbayern (05. auf 06.), im August 12.5 K in Neuhaus a.Rw./Thüringer W. (12. auf 13.).
Temperaturrekorde (Tagesmaximum):
Höchstwerte für die 2. Dekade im März: am 17. in Bendorf/Rhein 24.6 °C, Karlsruhe 24.4 °C, Freiburg i.Br. 24.1 °C. Rekorde am 05. Oktober, z.B.: München/Stadt 28.2 °C (seit 1879) und am 24. Oktober, z.B.: Potsdam 19.9 °C (seit 1943), München/Flgh. 23.8 °C (seit 1992).
Warme Nächte
zum 05. bzw. 06. Februar in Norddeutschland verbreitet über 10°C, z.B.: Aachen 15.2 °C, Gardelegen/Altmark 15.3 , Köln 14.1 °C; zum 24. Oktober: Potsdam 14.4 °C.
Tagesmittel:
Extreme der Überschreitungen des vieljährigen Mittels eines Kalendertages (aus Graphiken S. 6-9 der Monatshefte): Februar um +4.8 K (Berlin 05.), März um +2.3 K (H`peißenbg. 18.), Oktober um +2.4 K (Bremen 24.).
Monatsmitteltemperatur
Mai, Juni und Juli waren überall zu kalt, der Dezember ohne das Norddeutsche Tiefland . Die Abweichungen des Mai reichten bis -1.9 K (Bad Hersfeld). Alle übrigen Monate waren zu warm. Am höchsten über dem vieljährigen Mittel lagen die Werte von Februar bis +3.2 K (Artern/Thüringen), April bis +2.8 K (Rostock-Warnemünde) und August bis +2.8 K (Greven/Münsterland).
Anzahl der Tage mit Gewitter
Es gab fast überall 16 Tage (Großer Arber/Bayerischer Wald) bzw. 17 Tage (Lichtenhain-Mittelndorf/Elbsandsteingebirge) bis 35 Tage (Neuhaus am Rennweg/Thüringer Wald), wobei die Gebiete mit 20 bis 30 Tagen überwogen; jedoch hatten Konstanz 36 Tage, Aachen, Wasserkuppe/Rhön, Freudenstadt und Stötten/Schwäbische Alb 37 Tage sowie der Brocken/Harz 38 Tage.
Intensive Niederschläge (>=50 mm in 24 Std.) wurden -meist im Gebirge- von Mai bis September gemessen, im Schwarzwald auch im Januar und in den Alpen auch im März registriert. Es fielen: **Januar** 102 mm (Freudenstadt (13.); **März** 101 Zugspitze (23.) bzw. 94 mm Wendelstein (24.); **Mai** 51 mm Stötten/Schwäb.Alb (06.) und Michelstadt-Vielbrunn/Odenwald (07.), 53 Wasserkuppe (07.), 52 Chemnitz und 55 Oschatz/Sachsen (10.); **Juni** 54 mm Freiburg i.Br. (02.); **Juli** 75 mm Zinnwald-Georgenfeld/Erzgeb. (08.); **August** 54 mm Feldberg/Schw. (05.), 55 Essen (12.), 51 Oberstdorf (26.); **September** 52 mm Kahler Asten/Rothaargeb. und 57 Schmücke/Thüringer Wald (22.), 53 mm Gr.Arber/Bayr. Wald (23.).
Starkniederschläge (Niederschlagsmessstellen >=50 mm in 24 Std.) mit Höchstwerten von ca. 30 Meldungen: 96.4 mm Ruhpolding/Kr. Traunstein (14.08.), 89.3 Bischofswiesen/Kr. Berchtesgadener Land (04.06.), 80.3 mm Lindau/Bodensee (25.09.), 80.0 mm Aschau-Stein/Kr. Rosenheim (14.08.).
Trockenperioden ohne messbaren Niederschlag
gab es in Januar und Februar keine, im Juni bis 8 Tage, im November bis 7 Tage, in den übrigen Monaten um 10 Tage. Maximal waren es 18 Tage in Saarbrücken im Mai (12.-29.), 16 Tage in Garmisch-P. im Dezember (01.-16.).
Sonnenscheinreiche Perioden
traten im Dezember gebietsweise an bis zu 10 Tagen auf (07.-16. Wendelstein 84 Stunden). Im ersten Monatsdrittel des August waren es 5 - 10 Tage (Helgoland, St. Peter Ording/ Eiderstedt 138 Std.), vom 01. - 10. September meldeten etwa 60% der Stationen viel Sonne (Weiden 121 Stunden).

Anzahl der Tage mit Schneefall >0.1 mm 1)
Es gab überwiegend 26 (Düsseldorf) oder 27 Tage (Freiburg i.Br.) bzw. 28 (Helgoland,W`markelsdorf/Fehmarn) bis 50 Tage (Görlitz,Weinbiet/Pfälzer W.), im Alpenvorland bis 64 Tage (Fürstenzell), im Allgäu bis 67 (Oberstdorf) bzw. 75 Tage (Kempten), auf dem Hohenpeißenberg 89 Tage, in vielen Mittelgebirgen in Lagen unter ca. 1000 m ü. NN bis 104 (Wasserkuppe) oder 107 Tage (Zinnwald-G./Erzgeb.) bzw. 121 (Schmücke/Th.W.) und über etwa 1000 m ü. NN bis 128 (Brocken) oder 130 Tage (Fichtelbg./Erzgeb.) bzw. 133 (Gr.Arber), in den Alpen bis 132 (Wendelstein) bzw. 205 Tage (Zugspitze).
Schneeverhältnisse
Im ersten und letzten Drittel des **Januar** erreichte die fast geschlossene Decke im nördlichen Tiefland bis 10, im östlichen bis 30 cm, im Mittelgebirge zwischen 80 (Schmücke) und 230 cm (Brocken). Im Alpenraum lagen nach vorübergehender Abnahme am Monatsende 30 - 50 cm, am Wendelstein bis 125, auf der Zugspitze 310 cm. Nach starkem Abschmelzen Anfang **Februar** gab es zur Monatsmitte wieder eine geschlossene Decke, in den Alpentälern bis 60 cm (Oberstdorf), im Mittelgebirge zwischen 45 (Kahler Asten) und 150 cm (Brocken), am Wendelstein 87, auf der Zugspitze 320 cm. Nach Tauwetter lag zwischen 06. und 12. **März** überall Schnee, im Tiefland bis 10 cm, im Mittelgebirge 27 (Wasserkuppe) bis 155 cm (Brocken). Auf Abtauen folgte Zuwachs im Mittelgebirge, im Süden das Monatsmaximum (Wendelstein 141 cm, H`peißenberg 42, Alpentäler bis 56 cm). Die Zugspitze hatte nach 150 cm Neuschnee an einem Tag (Rekord!) das Jahresmaximum von 460 cm. Tauwetter zum Monatsende hinterließ oberhalb 1000 m ü. NN zwischen 30 (Feldbg./Schw.) und 110 (Wendelst.), auf der Zugspitze 410 cm. Im **April** lagen dort bis 20. noch maximal 35 cm (Feldbg.), 90 cm(Wendelst.), 380 cm (Zugsp.). Die Mittelgebirge hatten für wenige Tage bis zu 20 cm. Bis 31. **August** blieben auf der Zugspitze 30 cm. Erster Neuschnee fiel Ende **September** (Wendelstein 12 cm, Zugspitze 60 cm). Nach durchbrochener Decke in den Gipfellagen im **Oktober** folgte ab 10. **November** für kurze Zeit eine bis ins Flachland geschlossene Decke. Bis Mitte **Dezember** lag nur in Mittelgebirgen bis maximal 66 cm Schnee (Fichtelbg.). Danach reichte die Decke bis zum Weihnachtstauwetter tiefer hinab (Freudenstadt 46, Stötten 15 cm). Am Monatsende lag noch in den Höhenlagen Schnee (Chemnitz 15 cm, Oberstdorf 40, Gr. Arber 80, Zugspitze 120cm).
Besondere Wettererscheinungen
Kleine **Tornados** gab es im Januar in Drochtersen/Kr. Stade, im Mai in Lollar/Kr. Gießen, im Juni in Marne/Kr. Dithmarschen, auf Borkum und in Michelsen/Kr. Köthen sowie im Juli in Duisburg. **Saharastaub** gelangte am 21. Februar bis nach Deutschland.
Hagel fiel örtlich im April, verbreitet von Mai bis Juli, örtlich im August und vereinzelt noch im Oktober. Im Juli soll in Hamburg Taubeneigröße erreicht worden sein, sonst gab es im Juli Korngrößen bis 4 cm, im April bis 1.5 cm, im August und Oktober bis 2 cm.
Wetterschäden
Durch **Schnee- und Eisglätte** in Januar, Februar und März sowie im Dezember war der Straßenverkehr und zeitweise auch der Betrieb auf Flughäfen behindert. Größere Probleme verursachten **Eisregen** in Schleswig-Holstein im Januar, eine **Graupel**decke auf der A 96 bei Leutkirch/Württembergisches Allgäu im April und nach **Hagel** eine 40 cm hohe Decke auf der A 9 in Oberfranken im Juli. **Trockenschäden** gab es in der Landwirtschaft bereits im April. Überschwemmungen nach **Starkniederschlägen** wurden im Mai aus Strausberg gemeldet. Bei **Nebel** stießen im November Schiffe auf dem Rhein zusammen. Der **Tornado** in Michelsen/Kr. Köthen hinterließ Schäden an 75% der Häuser.

1) Tage mit Schneefall = *ganz oder teilw. aus festen Niederschlägen (Schnee, Hagel, Graupel)*

Frosttage (Min.<0.0°C) sind weniger als 75 verbreitet an der Küste (Helgoland 36,Norderney 47) und in den tieferen Lagen der Westhälfte (Düsseldorf 51,Aachen 52), mehr als 100 in den vielen Mittelgebirgen, im Vogtland und verbreitet südöstlich von Tübingen-Bamberg, mehr als 125 in höheren Mittelgebirgen (Kl. Feldberg/Taunus 128, Kahler Asten/ Rothaargeb.141,Wasserkuppe/Rhön 143), im Allgäu (Kempten 127), in Alpentälern (Garmisch-Partenkirchen 138, Oberstdorf 148), mehr als 150 auf Gipfeln von Harz (Brocken 168), Bayerischem (Gr.Arber 167) und Südschwarzwald (Feldberg 163), in Erzgebirge (Fichtelberg 171,Zinnwald-Georgenfeld 152) und Alpen (Wendelstein 186,Zugspitze 304),sonst 75 bis 100 zu erwarten.
Eistage (Max.<0.0°C) sind weniger als 25 im Norden (besonders westlich Elbe-Trave), um Dresden und verbreitet in den Lagen unterhalb von ca. 400 m über NN (Helgoland,Köln 11; Aachen, Bocholt 13), dabei weniger als 10 abschnittsweise am Niederrhein (Düsseldorf 8),mehr als 50 in Harz, Rothaargebirge(Kahler Asten 65),Hochtaunus(Kl.Feldbg.57), Rhön(Wasserkuppe 70) und Erzgebirge,vom Thüringer bis zum Bayerischen Wald,verbreitet in Schwarzwald und Alpen,mehr als 75 in Gipfellagen von Harz (Brocken 97), Erzgebirge(Zinnwald-G. 82,Fichtelberg 100),Südschwarz-(Feldberg 85) und Bayerischem Wald (Gr.Arber 89) und in den Hochlagen der Alpen (Wendelstein 91,Zugspitze 219), sonst 25 bis 50 zu erwarten.
Sommertage (Max.>=25.0°C) sind weniger als 10 verbreitet an der Küste (Helgoland 1,Arkona/Rügen 2), in hohen Mittelgebirgen wie Rothaargebirge(Kahler Asten 4),Taunus (Kl.Feldbg. 5),Rhön(Wasserkuppe 3), Harz(Brocken 0), Erzgebirge(Zinnwald-G. 3,Fichtelbg. 2), Südschwarz- (Feldberg 0) und Bayerischem Wald (Gr.Arber 2), auf dem Hohenpeißenberg (8) und in höheren Alpenlagen (Wendelstein, Zugspitze 0), mehr als 25 verbreitet in tieferen Lagen südlich von Bremen-Neubrandenburg, an Oberweser, Rhein, Main, Donau und vielen Nebenflüssen und am Bodensee, mehr als 50 am Oberrhein (Mannheim 51, Karlsruhe 53), sonst 10 bis 25 zu erwarten.
Heiße Tage (Max.>=30.0°C) sind keine auf Helgoland, in Gipfellagen der höchsten Mittelgebirge östlich des Rhein (z.B.:Rothaargebirge,Harz,Rhön,Erzgebirge,Bayerischer und Schwarzwald) und in den Alpen; mehr als 5 verbreitet zwischen Wendland-Uckermark und Erfurt-Pirna, verbreitet in den Einzugsgebieten von Rhein, Mosel, Lahn, Main, Neckar und vielen Nebenflüssen, am Bodensee und an der Donau (unterhalb Ulm), mehr als 10 am Oberrhein (Mannheim 11,Karlsruhe 12), sonst überwiegend bis 5 zu erwarten.
Tage mit einer Niederschlagshöhe von 0.1 mm und mehr sind weniger als 175 teilweise an der Ostsee (Fehmarn 162), verbreitet nordöstlich Greifswald-Eisenach-Görlitz (Spreewald 168,Thüringer Becken 167,Oderbruch 156), im Rhein-Main-Gebiet (Rheingau, Frankfurt 168), am mittleren Neckar (Stuttgart 166) und im Raum Regensburg (171), mehr als 200 verbreitet nördlich von Unterelbe-Trave (Hamburg 202,Schleswig 212), an unterer Ems (Lingen 205), in vielen Mittelgebirgen (Kl.Feldbg./Ts.211,Wasserkuppe/Rhön 212, Erzgebirge 214, Feldbg./Schw. 225) und in Teilen der Alpen (Zugspitze 219), mehr als 225 in Rothaargebirge (Kahler Asten 239) und Oberharz (Brocken 261), überwiegend 175 bis 200 zu erwarten.
Tage mit einer Niederschlagshöhe von 1.0 mm und mehr sind weniger als 100 im Oderbruch (Manschnow 97), von Magdeburg entlang der Saale bis zum Thüringer Becken (Artern 91), mehr als 125 häufig in Norddeutschland (westl. Lübeck-Hannover), Mittelgebirgsraum, Oberschwaben, Alpenvorland, an Rhein(oberhalb Karlsruhe) und Bodensee,mehr als 150 in Mittelgebirgen östl. des Rhein (Rhön 155;Wester-,Nordschwarz-, Bayr.W. 156;Erzgeb.162, Sauerland 166), teils in Allgäu und Alpen (Oberstdf. 162, Wendelst. 163), mehr als 175 auf Zugspitze(178),Feldb./Schw. (178),Kahlem Asten (176), im Oberharz 205 (Brocken),sonst 100 bis 125 zu erwarten.
Tage mit einer Niederschlagshöhe von 10.0 mm und mehr sind mehr als 25 um Schleswig (27), in vielen Mittelgebirgen (Gr. Arber/ Bayr.W. 47,Kahler Asten/Rothaarg.50),vom Kaiserstuhl bis zum Bodensee, am Alpenrand (Kempten 42), mehr als 50 im Schwarzwald (Freudenstadt 58,Feldbg.66), örtlich im Harz (Brocken 60), in Teilen von Allgäu und Alpen(Oberstdorf 66,Wendelstein 61,Zugspitze 72), meist 10 (Magdeburg,Neuruppin,Manschnow/Oderbruch) bis 25, im "Teltow" bei Berlin und in Artern/Thüringer Becken 9 zu erwarten.

Diese Werte wurden um mehr als 10 Tage verbreitet in Nordrhein-Westfalen, Weserbergland, im Alpenvorland um Mühldorf (12) sowie Augsburg (13) und Lübeck (15); mehr als 15 am Oberrhein bei Lahr (16), in Nordhessen (Kassel 19), im Elbsandsteingebirge und am Niederrhein (Düsseldorf 25) übertroffen. Sie wurden um mehr als 10 Tage an den Küsten, gebietsweise im Norddeutschen Tiefland, im Erzgebirge (Fichtelbg. 13) und in Koblenz (14); mehr als 15 an der Nordsee (St. Peter-Ording 18), von München (20) bis zu den Alpen; mehr als 20 auf Fehmarn (21) und Wendelstein (24) unterschritten. Sonst lagen die Abweichungen bei +- 10 Tagen.
Diese Werte wurden fast überall unterschritten: um mehr als 10 Tage im Norddeutschen Tiefland häufig (Braunschweig 16), vom Weserbergland über Osthessen bis in die tieferen Lagen von Thüringen (Artern 17), auf der Zugspitze (14), von Würzburg bis zum mittleren Neckar (Stuttgart/Schnbg. 13), um Konstanz (12), in Aachen (11). Auf Kahlem Asten und Hohenpeißenberg wurden sie um 1 Tag, im Oberallgäu bis 3 Tage (Oberstdorf), im Hunsrück bis 6 (Hahn), auf dem Wendelstein um 7, im Schwarzwald und auf Schwäbischer Alb bis 10 (Stötten), vom Erzgebirge bis Niederbayern bis 11 (Fürstenzell), im Bayerischen Wald bis 23 Tage (Gr.Arber) übertroffen.
Diese Werte wurden in Weserbergland-Rothaargebirge bis 3 Tage (Kahler Asten), östlich von Lübeck-Meiningen-Weiden-Mühldorf meist bis 5, auf Fehmarn um 7, gebietsweise von Usedom bis zum Spreewald bis 9 Tage (Angermünde) unterschritten; sonst überwiegend erreicht bzw. bis 5 Tage, in Lübeck und Lingen/Ems um 6, südlich von Düsseldorf-Marburg-Würzburg-Schwandorf/Oberpfalz verbreitet bis 10 Tage (z.B.: Weinbiet/Pfälzer Wald), in Aachen und Stötten/Schwäbische Alb um 11, vom Mittelrhein bis zum Bodensee bis 14 (Karlsruhe,Freiburg i.Br.), im Raum München bis 18 Tage übertroffen.
Diese Werte wurden in Wittenberg um 2 Tage, nordwestlich Köln-Schwerin gebietsweise bis 3 (z.B.:Norderney,Lübeck, Osnabrück), vom Bodensee bis zur Ortenau, verbreitet zwischen Trier-Goslar und Freudenstadt-Landshut bis 5 Tage (z.B.:Bamberg,Frankfurt/M.), in Regensburg um 6, in den tieferen Lagen von Baden-Württemberg bis 10 (Karlsruhe) bzw. 11 Tage (Stuttgart/Schnbg.) übertroffen, sonst erreicht bzw. bis 5 Tage (Dresden,Lindenberg/Brandenbg.) unterschritten.
Diese Werte wurden nördlich des Main in kleineren Gebieten bis 9 (Aachen), im Süden von Baden-Württembg. bis 14 Tage (Freudenstadt) unterschritten, verbreitet erreicht bzw. bis 10 Tage (z.B.:Kempten,Neuruppin) übertroffen, um mehr als 10 auf dem Brocken (22), vom östlichen Emsland bis Nordfriesland (Oldenbg.,Cuxhaven 29), von Ostholstein über Vorpommern bis zum Oderbruch(W`markelsdf./Fehmarn 26,Ueckermünde 28), vom Erzgebirge bis zum Hunsrück (Fichtelbg. 32, Hahn 21), vom mittleren Neckar bis Oberpfälzer-Bayerischer Wald (Stuttgart/Schnbg. 26,Regensbg. 25), vom unteren Inn bis zum Starnberger See (München/Stadt,Wendelstein 21).
Diese Werte wurden im Norden örtlich bis 4 (Neubrandenbg., Norderney), vom Rhein bis Westrand Thüringer-Bayerischer Wald gebietsweise bis 10 Tage (Bad Hersfeld), in Bad Kissingen um 11. auf dem Feldberg/Schw. um 14 Tage unterschritten, überwiegend erreicht bzw. bis 10 Tage (z.B.:Dresden) übertroffen, um mehr als 10 von Helgoland bis zum Oderhaff (Bremerhaven 22), um Neuruppin, Paderborn, Essen, im Hunsrück, auf Alpengipfeln , von der Frankenalb bis Thüringer-Bayerischer Wald (Gr.Arber 22), verbreitet von Wittenberg-Cottbus bis Erzgebirge (Zinnwald-G. 22,Fichtelbg. 29).
Diese Werte wurden nördlich Eifel-Rhön-Spreewald häufig um 3 bis 10 (Eiderstedt), östlich Weißenburg-Plauen-Meißen teils um 3 bis 8 (Regensbg.),auf dem Fichtelbg./Erzg. um 18 Tage, sonst vereinzelt um 3 (z.B.:Lahr) oder 4 (z.B.: Würzbg.) über-, an Neiße-Oder um 3 bis 7 (Manschnow), südwestlich Frankfurt/M.-Mühldf. verbreitet um 3 bis 11 (z.B.:Freudenst.), auf dem Feldbg./Schw. um 20 Tage, sonst örtlich um 3 bis 7 (z.B.:Lüdenscheid) unterschritten,meist um +-2 Tage verfehlt.

12) **Sicht < 1000 m** = *Nebel*

13) **%** = *Bezug zum vieljährigen Mittel (1961-1990)*

– **Zeichen .** = *nicht aufgetreten*

– **kein Zeichen/Wert** = *lag zum Redaktionsschluss nicht vor (Messausfall, Station ruht)*

14) Summe aller Tage mit x Stunden Sonne:

Dezember: x =6 Stunden
Januar, November: x =7 Stunden
Februar, Oktober: x =8 Stunden
März, September: x =10 Stunden
April, August: x =11 Stunden
Mai, Juli: x =12 Stunden
Juni: x =13 Stunden

INFORMATION

Die Witterung in Deutschland 2004 - eher durchschnittlich

Nachdem im Laufe des Jahres 2004 der Witterungsverlauf jedes Monats dokumentiert wurde, folgt nun eine Zusammenfassung des Jahres. Die Mittelwerte beziehen sich auf die gesamte Fläche von Deutschland. Regionale Unterschiede sind hierbei nicht berücksichtigt.

Insgesamt war das Jahr 2004 in Deutschland - abgesehen von Spätfrühling und Frühsommer - recht warm, wenn auch nicht so extrem wie das Vorjahr, und durchschnittlich hinsichtlich Niederschlag und Sonnenschein.

Die Mitteltemperatur für Deutschland, berechnet aus einem interpolierten 1-km-Raster betrug 9,0 °C [1]. Das sind 0,7 K mehr als im internationalen Referenzzeitraum 1961-1990.
Damit war das Jahr 2004 das 20. wärmste seit 1901.

Hinsichtlich der Sonnenscheindauer gab es im Jahr 2004 sechs über- und sechs unterdurchschnittliche Monate. Da die Überschüsse etwas größer als die Defizite waren, ergab sich eine Jahressumme, die etwas über dem Bezugswert lag.
Das Gebietsmittel der Sonnenscheindauer für das Jahr 2004 betrug 1589 Std.
Das sind 61 Std. oder 4 % über dem Normalwert.

Das Jahr 2004 hatte in Deutschland 7 Monate mit über- und 5 Monate mit unterdurchschnittlicher Niederschlagshöhe.
Für das gesamte Jahr resultierte keine wesentliche Abweichung vom langjährigen Bezugswert. Das Gebietsmittel der jährlichen Niederschlagshöhe ergab sich zu 812 mm. Das sind 23 mm oder 3 % mehr als in der Referenzperiode.
Das Jahr 2004 war damit das 44. feuchteste seit Beginn des 20. Jahrhunderts.

Dipl.-Met. Gerhard Müller-Westermeier, Deutscher Wetterdienst Offenbach

1) Die Werte sind Gebietsmittel aus allen haupt- und nebenamtlichen Stationen
