Tägliche Beobachtungen von 28 Stationen	1
Sonnenscheindauer, Tagessummen von 34 Stationen	169

Einleitung

Der vorliegende Teil I des Deutschen Meteorologischen Jahrbuches für 1942 umfaßt die täglichen Beobachtungen an 28 Stationen sowie die Tagessummen der Sonnenscheindauer an 34 Stationen.

Aus finanziellen Gründen müssen diejenigen Stationen von einer weiteren Veröffentlichung in extenso ausgeschlossen werden, deren Beobachtungsreihen von 1941—1944 größere Lücken aufweisen, bzw. deren Tabellen durch Kriegseinwirkung nicht mehr greifbar sind.

Die seit 1. April 1940 gesetzlich eingeführte Deutsche Sommerzeit (DSZ) endete am 2. November 1942 um 02 Uhr. Die Beobachtungstermine und alle Zeitangaben beziehen sich also bis einschließlich 1. November auf DSZ. Ab 2. November bis Jahresende gilt wiederum die Mitteleuropäische Zeit (MEZ). Lediglich die Stationen Wahnsdorf, Frankfurt/M. und Hohenpeißenberg beobachteten das ganze Jahr hindurch nach MEZ. Alle Zeitangaben dieser Stationen beziehen sich auf MEZ.

Beim Zentralamt des Deutschen Wetterdienstes in der US-Zone wurden Untersuchungen über die Vergleichbarkeit der Lufttemperaturbeobachtungen nach DSZ und MEZ durchgeführt. Bei den Terminwerten und den Tagesmitteln können in Abhängigkeit von der Wetterlage Differenzbeträge von mehreren Grad Celsius auftreten, namentlich beim Durchzug kräftiger Fronten zwischen 20 und 21 Uhr MOZ. Die Monatsmittel nach DSZ übersteigen die Monatsmittel nach MEZ selten um mehr als 0.3 Grad Celsius. Naturgemäß sind die Unterschiede bei großen Temperaturamplituden größer als bei kleineren.

Eine Reduktion aller Elemente auf MEZ ist nicht möglich. Es wurde deshalb verzichtet, Korrektionen hinsichtlich der Beobachtungszeit anzubringen, um die Vergleichbarkeit der einzelnen Elemente miteinander zu wahren.

Die Veröffentlichung schließt sich nach ihrer äußeren Form und Anordnung des Inhalts der Veröffentlichung des Teiles I des Deutschen Meteorologischen Jahrbuches für 1941 genau an.

Im einzelnen werden abgedruckt:

Tägliche Beobachtungen der Stationen:

Aachen	Frankfurt a. M.	Kaiserslautern	Neuwied
Berlin-Dahlem	Freiburg i. Br.	Karlsruhe	Nürnberg
Bremen	Großer Inselsberg	Königsberg/Pr.	Rügenwalde
Deutsch-Krone	Hamburg	Marburg	Schmatzfeld
Feldberg/Schw.	Helgoland	Meiningen	Schneekoppe
Fichtelberg	Hohenheim	München	Wahnsdorf
Flensburg	Hohenpeißenberg	Münster i.W.	Zugspitze

Tagessummen der Sonnenscheindauer:

Aachen	Feldberg/Schw.	Kiel-Holtenau	Nürnberg
Ahrweiler	Fichtelberg	Kolberg	Ravensburg
Berlin-Dahlem	Frankfurt a. M.	Königsberg/Pr.	Schneekoppe
Böblingen	Freiburg i. Br.	Königstuhl	Treuburg
Braunschweig	Greifswald	Landsberg	Wahnsdorf
Bremen	Hamburg	Lyck	Warmbrunn, Bad
Breslau	Helgoland	Marburg	Wilhelmshaven
Brocken	Kahler Asten	München	Zugspitze
Erfurt	Kalmit

Erläuterungen zu den Tabellen

I. **Tägliche Beobachtungen** von 28 Stationen (S. 1—168):

Angaben im Tabellenkopf:

φ = Geographische Breite.
λ = Geographische Länge von Greenwich.
g = Schwerebeschleunigung.
ΔG = Zeitunterschied gegen Greenwich.
H_s = Höhe des Geländes über Normal-Null in der Nähe der Thermometeraufstellung.
H_b = Höhe des Barometers über Normal-Null.
h_t = Höhe der Thermometer über dem Erdboden. In Klammern ist die Art der Thermometeraufstellung (Hütte oder Gehäuse) angegeben.
h_r = Höhe der Auffangfläche des Regenmessers über dem Erdboden.

Den Bezeichnungen für die einzelnen Elemente sind die international vereinbarten Buchstabenbezeichnungen (P, T, e, U, D, F, V, N, w, R, h_s, W) hinzugefügt.

Beobachtungstermine*): 7^h, 14^h, 21^h gesetzlicher Zeit + Zeitdifferenz des Ortsmeridians gegen 15° ö. L.

Gesetzliche Zeit = 1. I.—1. XI. Deutsche Sommerzeit (DSZ): 7^h, 14^h, 21^h DSZ entspricht 6^h, 13^h, 20^h MEZ.
2. XI.—31. XII. Mitteleuropäische Zeit (MEZ): 7^h, 14^h, 21^h MEZ.

Luftdruck (P) in mm, auf 0° Quecksilbertemperatur und Normalschwere von 45° umgerechnet.

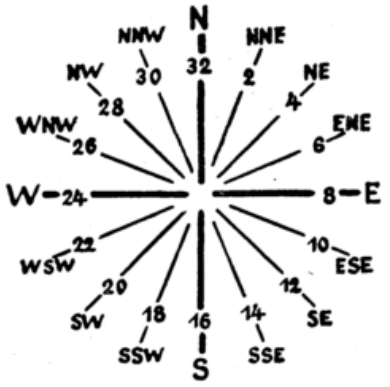

Lufttemperatur (T) in C°. Die Tagesmittel sind berechnet nach der Formel: $\frac{7^h + 14^h + 2 \times 21^h}{4}$

Die Temperaturextreme werden zum Abendtermin für die vorhergehenden 24 Stunden bestimmt und dem Datum des Messungstages zugeschrieben.

Dampfspannung (e) in mm.

Relative Feuchtigkeit (U) in Prozent. Die Tagesmittel sind arithmetische Mittel aus den Terminwerten.

Richtung des Windes (D) in Schlüsselzahlen. Die Bedeutung ist aus der folgenden Windrose ersichtlich.

Windstille = 00

Stärke des Windes (F) nach der Beaufortskala (0—12).

Sichtweite (V) nach der internationalen Skala. Es bedeuten:

0 =	Sichtweite	unter	50 m		
1 =	„	von	50 m	bis	200 m
2 =	„	„	200 m	„	500 m
3 =	„	„	500 m	„	1 km
4 =	„	„	1 km	„	2 km
5 =	„	„	2 km	„	4 km
6 =	„	„	4 km	„	10 km
7 =	„	„	10 km	„	20 km
8 =	„	„	20 km	„	50 km
9 =	„	über	50 km		

Bewölkung: Die Spalte enthält:
Grad der Bewölkung (N) (0—10).
Dichte der Bewölkung ($^{0-2}$).
Wetter zum Termin (w): Die Zeichen für ≡, ✳, △, ⁂, ▲, ≡, ⊓, ⊙ sind eingesetzt, wenn die entsprechende Erscheinung im Augenblick der Beobachtung wahrgenommen wurde.

*) Ausnahmen siehe im Einleitungstext, Absatz 3.

Niederschlag (R) in mm, für den Morgentermin für die vorhergehenden 24 Stunden aus den Terminmessungen errechnet und dem Datum des Messungstages zugeschrieben.

Schneehöhe (h_S) in Zentimeter, gemessen zum Morgentermin.

Witterungsverlauf (Bemerkungen) (W): Die Spalte enthält die Beobachtungen über den Ablauf der Witterung unter Angabe der Stärke der betr. Erscheinungen durch die hochgestellten Zahlen $^{0-2}$ und der Zeit des Auftretens (nach gesetzlicher Zeit). Die Bemerkungen werden bei Bedarf durch Fußnoten unter der Tabelle ergänzt.
