# Einleitung

Der vorliegende Teil II des Deutschen Meteorologischen Jahrbuches für 1944 umfaßt die Monats- und Jahresergebnisse an den Stationen höherer Ordnung einschließlich der Sonnenschein- und Erdbodentemperaturbeobachtungen. Die Ergebnisse werden in der durch die Internationale Meteorologische Organisation vorgeschriebenen Form veröffentlicht. Die Veröffentlichung umfaßt eine Auswahl der meteorologischen Stationen.

Gegenüber dem Jahrbuch 1937 mußte der Umfang des Jahrbuches 1944 aus finanziellen Gründen gekürzt werden. Es entfallen fortan die Stationsbeschreibungen, die Veränderungen an den Stationen, das Verzeichnis der Stationen nach politischen Bezirken, die Aufstellung der Eis-, Frost- und Sommertage, der Witterungsverlauf, die Minimumtemperaturen und die Summen aus dreimal täglichen Niederschlagsbeobachtungen.

Wichtige Veränderungen an den Stationen werden, soweit sie bekannt sind, weiterhin als Fußnoten zu den Monats- und Jahresergebnissen veröffentlicht.

Mit dem Jahrgang 1944 schließt diese seit 1934 erscheinende Reihe. Die Fortsetzung bilden ab 1945 die Jahrbücher der einzelnen Besatzungszonen.

Dieser Teil wurde in der Abteilung K (Klima) unter Leitung von Prof. Dr. K. Schneider - Carius durch Dr. J. Huttary bearbeitet.

# Verzeichnis der Stationen höherer Ordnung

Erläuterung: In dem Verzeichnis erscheinen sämtliche vorhandenen Stationen mit Angabe der Seitenzahl der Veröffentlichung, der Ordnung, der Ausrüstung mit Sonderinstrumenten, der Koordinaten, des Einrichtungsjahres und des Beobachters. Stand: 31. 12. 1944.

Es bedeuten:

II = Station II. Ordnung
II¹) = Station II. Ordnung ohne Barometer
III = Station III. Ordnung
E = Messung der Erdbodentemperatur
A = Registrierung der Strahlung Sonne + Himmel
⊙ = Registrierung der Sonnenscheindauer
B = Registrierung des Luftdrucks
T = Registrierung der Lufttemperatur
F = Registrierung der Luftfeuchtigkeit
W = Registrierung des Windes (Richtung oder Stärke)

# Erläuterungen zu den Tabellen

**Monats- und Jahresübersichten**

Angaben im Tabellenkopf:

$\varphi$ = geographische Breite
$\lambda$ = geographische Länge von Greenwich
g = Schwerebeschleunigung
$\triangle G$ = Zeitunterschied gegen Greenwich
$H_s$ = Höhe des Stationsgeländes über Normal-Null. (Angaben in ganzen Metern)
$H_b$ = Höhe des Barometers über Normal-Null
$h_t$ = Höhe der Thermometer über dem Erdboden. In Klammern ist die Art der Thermometeraufstellung (Hütte oder Gehäuse) angegeben
$h_r$ = Höhe der Auffangfläche des Regenmessers über dem Erdboden

Beobachtungstermine: $7^h$, $14^h$, $21^h$ gesetzlicher Zeit + Zeitdifferenz des Ortsmeridians gegen 15° ö. L.
Gesetzliche Zeit: 3. IV.—1. X. Deutsche Sommerzeit (DSZ); $7^h$, $14^h$, $21^h$ entspricht $6^h$, $13^h$, $20^h$ MEZ
1. I.—2. IV. und 2. X.—31. XII: $7^h$, $14^h$, $21^h$ MEZ

Bei den Stationen Wahnsdorf und Frankfurt/M. beziehen sich alle Zeitangaben weiterhin auf MEZ.

Luftdruck Pm = Luftdruck in mm, auf 0° Quecksilbertemperatur und Normalschwere von 45° umgerechnet.
Po, m = Luftdruckmittel im Meeresspiegel.

Lufttemperatur in C°. Die Tagesmittel sind berechnet nach den Formeln

$$\frac{7^h + 14^h + 2 \times 21^h}{4}$$

Die Temperaturextreme werden zum Abendtermin (III) für die vorhergehenden 24 Stunden bestimmt und dem Datum des Messungstages zugeschrieben.

Windverteilung und mittlere Windstärke:

Zahl der Beobachtungen in einer bestimmten Windrichtung. Beobachtungen mit Zwischenwindrichtungen sind je zur Hälfte bei den benachbarten Hauptwindrichtungen gezählt (z. B.: NNE je zur Hälfte bei N und bei NE).
Die mittlere Windstärke ist gleich die Summe der Stärkezahlen einer bestimmten Windrichtung dividiert durch die Summe der Häufigkeit derselben bestimmten Windrichtung. Bei Zwischenrichtungen muß die Stärke je zur Hälfte bei den benachbarten Hauptwindrichtungen gezählt werden. (z. B.: NNE 4 = N 2 u. NE 2).

Beispiel: Bei N als Summe der Stärke = 48
als Summe der Häufigkeit = 16
die mittlere Windgeschwindigkeit = 48 : 16 = 3.0

Dampfspannung (Mittel) in mm.
Relative Feuchtigkeit in Prozent.
Bewölkung nach elfstufiger Skala (0—10).
} Die Tagesmittel sind arithmetische Mittel aus den Terminwerten.

Niederschlag in mm: Der Niederschlag wird für den Morgentermin (I) für die vorhergehenden 24 Stunden aus den Terminmessungen errechnet und dem Datum des Messungstages zugeschrieben.

Zahl der Tage n:

mit Lufttemperatur Max. $< 0.0$, Min. $\leq -10.0$, Min. $< 0.0$, Max. $\geq 25.0$, Max. $\geq 30.0$, Min $\geq 20.0$
mit Windstärke F $\geq 6$, $\geq 8$
mit Bewölkung N $< 2.0$, $> 8.0$ (Tagesmittel)
mit Niederschlag R $\geq 0.1$ mm, $\geq 1.0$ mm, $\geq 10.0$ mm
mit Regen (◯)
mit Schnee (✳ ⦿) : die von Schnee oder Regen und Schnee herrührende Schmelzwassermenge hat mindestens 0.1 mm betragen
mit Schneedecke ( )zum Morgentermin
mit Hagel (△ ▲), (einschließlich Eiskörner)
mit Graupeln (△ △ ✳)(einschließlich Grieseln und Reifgraupeln)
mit Nebel ($\equiv^{0-2}$), Sicht unter 1 km
mit Gewitter (K). Ferngewitter ((K)) eingerechnet

Durch kursiven Druck sind hervorgehoben: Unsichere oder ganz bzw. teilweise ergänzte Werte.

**Besondere Zusammenstellungen**

1. Frost- und Schneedeckengrenzen.

Frostgrenzen: Datum des letzten (ersten) Temperaturminimums unter 0°.
Schneedeckengrenzen: Datum des letzten (ersten) Tages mit einer Schneedecke von 1 cm oder mehr zum Morgentermin.

2. Fünftägige Mittel.

Die Abweichungen beziehen sich meist auf die Normalmittel 1851—1930.

**Sonnenscheinbeobachtungen**

Angaben im Tabellenkopf:

$\varphi$, $\lambda$ und $H_s$ wie bei Monats- und Jahresübersichten.
$h_s$ = Höhe der Sonnenscheinkugel über dem Erdboden.
Die Werte sind aus Registrierungen mit dem Sonnenscheinautographen Campbell-Stokes gewonnen.

**Erdbodentemperaturen**

Angaben im Tabellenkopf wie bei Monats- und Jahresübersichten.

Die Gefäße der Thermometer für 0.1 und 0.2 m Tiefe sind unmittelbar in den Erdboden eingegraben. In den Tiefen von 0.5 und 1.0 m werden die Beobachtungen an Thermometern angestellt, die in das untere Ende von Holzstangen eingelassen sind und in Schutzröhren meist aus Neusilber in den Boden eingeführt werden.
