**D**urch die Kriegereignisse sind in der Einsendung der Beobachtungen und Beförderung der Instrumente mannigfache Unterbrechungen eingetreten, welche die Anzahl der Nachträge gesteigert haben. Auch sind durch Einberufung einzelner Beobachter an manchen Stationen die Beobachtungen selbst unterbrochen worden. Einen der thätigsten Beobachter, Professor Dellmann in Kreuznach, dessen Untersuchungen über die Luftpolarität nur theilweise veröffentlicht worden sind, hat das meteorologische Institut durch den Tod am 14. Juni 1870 verloren. — Die Abweichungen der fünftägigen Mittel von 1869 sind im dritten Theil der Darstellung der Wärmeerscheinungen durch fünftägige Mittel bereits erschienen, die von 1870 hingegen in eine Arbeit über die strengen Winter 18 $\frac{69}{70}$  und 18 $\frac{70}{71}$  aufgenommen, welche nächstens publicirt werden wird. Die altfranzösische, seit den 23 Jahren des Bestehens des Instituts gebrauchte Scala, Grade Réaumur und Pariser Linien für Barometer, Spannkraft der Dämpfe und Regenhöhe ist beibehalten, die Einheit dieser Scalen, Grad und Linie natürlich decimal getheilt. Die Theilung der Barometer durch den Nonius ist aber, um die Ablesung besonders Abends zu erleichtern, nicht auf 0 $''$ .01, sondern 0 $''$ .02, eben so die directe Theilung der Thermometer und Psychrometer nicht auf 0 $^{\circ}$ .1, sondern 0 $^{\circ}$ .2.

Die Beobachtungen von 1804—1806 sind von Professor Heller angestellt; das Thermometer befand sich in diesen drei Jahren wie bei dem jetzigen Observator, Dr. Gutberlet, im tiefsten Theile von Fulda. 1807—1809 befand es sich im höchsten Theile der Stadt, sowie auch in allen folgenden Jahren bei Dr. Schneider bis 1854. Zeit der Beobachtungen von 1804—1806 Morgens 8 oder 6 oder 7<sup>h</sup>, Nachmittags 2 oder 3<sup>h</sup>; häufig sind auch 3 oder 4 Beobachtungen am Tage, aber nicht zu regelmäßigen Stunden, gemacht worden. Dr. Schneider beobachtete zweimal täglich Nachmittags ziemlich regelmäßig um 2<sup>h</sup>. Vormittags im November, December, Januar und Februar meist um 8<sup>h</sup> (auch um 9<sup>h</sup>), im März, April Mai, September und October meist um 7<sup>h</sup>; im Juni, Juli und August meist um 6<sup>h</sup> (auch um 7<sup>h</sup> oder 5<sup>h</sup>).

Thermische und barische Windrose für Oppeln; berechnet von Herrn Buffa.
