(Dr. Engel).

V o r w o r t.

Das vorliegende XXV. Heft der Preussischen Statistik enthält wie die früheren Hefte VI., XII., XIV., XIX., XXIII. und XXIV. die Resultate der regelmässigen Beobachtungen des Jahres 1871, und zwar von sämmtlichen mit dem Meteorologischen Institut verbundenen deutschen Stationen. Zu den bereits bestehenden Stationen sind im Laufe des verflossenen Jahres folgende neue hinzugetreten:

Thorn seit December 1871, Beobachter: Herr Rector Hasenbalg, Beobachtungszeit: 6, 2, 10.

Calau seit October 1871, Beobachter: Herr Kataster-Kontrolleur v. Hartmann, Beobachtungszeit: 6, 2, 10.

Osnabrück seit August 1871, Beobachter: Herr Obergerichtsrath Kettler, Beobachtungszeit: 8, 2, 10.

Neustadt am Rennsteige (Thüringen) seit October 1871, Beobachter: Herr Lehrer Saueracker.

An letzterem, 2450 Par. F. über der Ostsee gelegenen Orte wird nur die Regenhöhe gemessen. Die Station Zechen ist am 29. September eingegangen, die Beobachtungen werden seit diesem Tage von Herrn Gube in Guhrau fortgesetzt. An Stelle des am 11. October v. J. verstorbenen Predigers Glotz zu Wang im Riesengebirge beobachtet seit dieser Zeit der Herr Lehrer Knappe daselbst. — Auch für den vorliegenden Jahrgang ist die altfranzösische, seit den 24 Jahren des Bestehens des Meteorologischen Instituts gebrauchte Scala, Grade Réaumur und Pariser Linien für Barometer, Spannkraft der Dämpfe und Regenhöhe beibehalten worden, die Einheit dieser Scalen, Grad und Linie natürlich decimal getheilt. Die Theilung der Barometer durch den Nonius ist aber, um die Ablesung besonders Abends zu erleichtern, nicht auf 0".01, sondern 0.02, ebenso die direkte Theilung der Thermometer nicht auf 0.1, sondern 0°.2 angenommen.

Inhalts-Verzeichnifs.

	Seite
Monatsmittel	1—26
Nachträge	56
Fünftägige Wärmemittel	26—39
Nachträge	56
Beobachtungen der Forststationen in Baiern	39—41
Beobachtungen zu Langensalza	41
Beobachtungen zu Oppeln	41—42
Beobachtungen auf der Landskrone	42
Regensummen der Stationen an denen nur Regen beobachtet	42
Dunstdruck für Temperaturen von 2 zu 2° R., 1863—1870, berechnet von Professor Dr. Suhle	42—43
Tägliche Mittel der Temperatur für Crefeld, berechnet von Dr. Loose	43—46
Monatsmittel der Temperatur, des Barometerstandes und der Regenhöhe sowie des Unterschiedes der absoluten Extreme, berechnet von Bertram	47—54
Abweichungen der monatlichen Mittel der Temperatur vom zwanzigjährigen Mittel 1871	55—56

Aus den vorstehenden Tafeln ist der Einfluss ersichtlich, den einerseits die Temperatur, andererseits die Windrichtung auf den Feuchtigkeitsgehalt der Luft hat. Die getrennte Berechnung der Mittags-Beobachtungen läßt den Einfluss des Courant ascendant besonders hervortreten.

Tägliche Mittel der Temperatur aus zweistündlichen Beobachtungen zu Crefeld von Herrn Dr. L. Lose.

Seit dem Beginn des preussischen Beobachtungssystems im Jahre 1848 ist in Crefeld unter der Leitung des Herrn Dr. Lose täglich neunmal von 2 zu 2 Stunden, von 7 Uhr Morgens bis 11 Uhr Abends, der Stand der meteorologischen Instrumente, sowie die Windrichtung und die Himmelsansicht aufgezeichnet worden. Von den Beobachtungen des Thermometers (beginnend am 1. Januar 1847), Barometers und Psychrometers sind 12 Jahre im Jahre 1861, nämlich 1848—1859, veröffentlicht worden. *) Die mittleren Werthe der Temperatur für die 16jährige Reihe 1848—1863 sind publicirt in Heft VI. der Preufs. Statistik p. 5. Mit dem 31. December 1867 ist diese Beobachtungsreihe geschlossen worden, seit dieser Zeit werden die Beobachtungen wie auch auf den andern Stationen dreimal täglich gemacht. Herr Dr. Lose hat nun aus den 21jährigen Beobachtungen des Thermometers die mittleren Werthe der Temperatur, und zwar die jedem Tage zukommenden Mittelwerthe der neun Stunden von 7 Uhr Morgens bis 11 Uhr Abends berechnet, welche hiermit veröffentlicht werden. Das Thermometer, mit dem sämtliche Beobachtungen angestellt wurden, ist von J. G. Greiner jun. in Berlin in ganze und fünftel Grade Réaumur'scher Scale getheilt und aufgehängt vor dem, nach Norden gelegenen Fenster über einer in dem baumfreien Garten befindlichen Plattform des Hinterhauses, 4½ Fufs vom Boden und 21 Zoll von Wand und Fenster entfernt. Zum Ablesen der Temperatur bediente man sich eines in der Fensterscheibe angebrachten Mikroskops, so daß dabei das Fenster nicht geöffnet zu werden brauchte. Wiederholte Vergleichen mit dem Reise-Normal-Thermometer des meteorologischen Instituts haben gezeigt, daß das Instrument vollkommen richtig ist und sich im Laufe der Jahre nicht verändert hat.

Werthe der Monatsmittel der Temperatur, des Barometerstandes und der Regenhöhe sowie des Unterschiedes der absoluten Extrême, für den 15jährigen Zeitraum 1855—1869; berechnet von Herrn Bertram.

Aus den seit dem Jahre 1855 in monatlichen Uebersichten veröffentlichten Beobachtungen des meteorologischen Instituts hat der meteorologische Observator Herr Bürgermeister Bertram zu Großbreitenbach für den Zeitraum 1855 bis 1869 die mittleren Werthe der Temperatur, des Barometerstandes und der Regenhöhe sowie der in jedem Monat beobachteten absoluten Schwankungen des Thermometers und Barometers berechnet. Da nicht für alle Stationen eine funfzehnjährige Beobachtungsreihe vorlag, so sind zwei Tafeln gebildet worden, von denen die erste die Stationen enthält, an denen während des ganzen Zeitraums beobachtet worden, die zweite die Stationen mit einer kürzeren Beobachtungsreihe. Die in [] gesetzten Zahlen bezeichnen die Anzahl der Jahre.

I. Stationen, an denen während des ganzen 15jährigen Zeitraums, 1855—1869, beobachtet worden.

Namen der Stationsorte.	Januar.					Februar.					März.
