# Einleitung

Der vorliegende Teil III des Deutschen Meteorologischen Jahrbuchs 1938 umfaßt die Ergebnisse der Niederschlagsbeobachtungen.

Während die Hefte 1—17 bereits vor dem Kriege durch das damalige Reichsamt für Wetterdienst veröffentlicht wurden, wurde infolge des Ausbruchs des Krieges die Veröffentlichung des Abschlußheftes Nr. 18 abgebrochen. Nur die Monats- und Jahresergebnisse dieses Heftes wurden kurz vor Kriegsausbruch noch ausgedruckt und haben daher die Bogen-Signatur „R. f. W." Die übrigen Teile wurden erst 1947 bearbeitet.

Von einer Auswahl von Stationen werden die täglichen Niederschlagshöhen und die täglichen Schneedeckenhöhen, sowie die Wassergehaltsbestimmungen veröffentlicht.

Die Monats- und Jahresergebnisse und die Tagesmengen von 50 mm und mehr werden von sämtlichen Stationen veröffentlicht, während die Auswertungen nach Stark- und Dauerregen nur ein Fragment darstellen, da der Großteil der Auswertungen durch Kriegsschäden vernichtet wurde.

Erst- und letztmalig erscheinen bei den Auswahlstationen und den Monats- und Jahresergebnissen die Stationen Österreichs.

Überall wurde die hydrographische Reihenfolge der Stationen zugrunde gelegt, doch bietet das einleitend zusammengestellte Stationsverzeichnis die Möglichkeit, Stationen eines bestimmten politischen Bezirkes aufzusuchen.

# Erläuterungen zu den Tabellen.

**I. Stationsverzeichnis.**

Im Verzeichnis erscheinen nach Ländern, Provinzen usw. geordnet sämtliche vorhandenen Stationen mit Angabe der Zugehörigkeit zu den kleineren Verwaltungseinheiten (Kreis, Bezirksamt, Amtshauptmannschaft, Oberamt, Bezirkshauptmannschaft, Amt usw.) und der Seitenzahl der Veröffentlichung der Monats- und Jahressummen bzw. der Stark- und Dauerregen.

Es bedeutet:

N Tägliche Niederschlagshöhen sind auf Seite 1—720 veröffentlicht.

S Tägliche Schneehöhen sind auf Seite 721—842 veröffentlicht.

R Auswertungen der Registrierungen sind als Stark- und Dauerregen auf Seite 951—957 veröffentlicht.

† Die Verhältniswerte zu den Normalwerten sind auf Seite 939—944 veröffentlicht.

* Die Reihe ist länger als ein Jahr unterbrochen.

Bei den österreichischen Stationen konnte das Einrichtungsjahr infolge fehlender Unterlagen nicht veröffentlicht werden.

**II. Tägliche Niederschlagshöhen.** Die Tabellen enthalten:

Flußgebiete I. und II. Ordnung, in Einzelfällen auch III. Ordnung;

Stationsnamen und Seehöhen;

Tägliche Niederschlagshöhen in mm und Kennzeichnung der Schneedecke, gemessen um 7 Uhr morgens.

Es bedeutet:
ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde;
ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊠) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind.
Eingeklammerte Werte sind ergänzt.
Eine Zahl unter einer Klammer (⏝) gibt die Gesamtmenge mehrerer Tage.

Monatssummen, Verhältnis zum Normalwert (in %) und Abweichung vom Normalwert (in mm); als Normalwerte sind die Mittel 1891—1930 zugrunde gelegt.

Zahl der Tage mit Niederschlag von mindestens 0.1 mm und 1.0 mm, mit Schnee und Schneedecke; als Tage mit Schnee (✳) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug.

**III. Tägliche Schneehöhen. Wassergehalt der Schneedecke.** Die Tabellen enthalten:

Flußgebiete I. Ordnung, in Einzelfällen auch II. Ordnung;

Stationsnamen und Seehöhen;

Tägliche Schneehöhen in cm, gemessen um 7 Uhr morgens.

Es bedeutet:
ein Punkt, daß eine Schneedecke nicht gelegen hat;
Fl., daß einzelne Schneeflecke vorhanden waren;
0, daß eine sehr dünne oder stellenweise durchbrochene, aber noch zusammenhängende Schneedecke gelegen hat;
⊠, daß eine Schneedecke vorhanden war, deren Höhe nicht gemessen wurde;
ein Strich oder ein freies Feld, daß eine Beobachtung nicht stattgefunden hat.

Wassergehalt der Schneedecke an bestimmten, aus der Überschrift ersichtlichen Tagen. Die Höhe der jeweils ausgestochenen Schneehöhe (in cm) und der gesamte Wassergehalt des ausgestochenen Schnees (in mm) sind angegeben.

**IV. Monats- und Jahresergebnisse.**

Monats- und Jahressummen, größte Tagesmengen. Die Tabellen enthalten:

Flußgebiete I. und II. Ordnung, in Einzelfällen auch III. Ordnung;

Stationsnamen und Seehöhen;

Monatsmengen in mm;

Jahressummen für das Kalenderjahr sowie Höhe und Datum der größten Tagesmengen;

Jahressummen für das Wasserwirtschaftsjahr (November bis Oktober).

Monats- und Jahressummen in Prozenten der Normalwerte.

Als Normalwerte sind die Mittel 1891—1930 zugrunde gelegt.

Es sind hervorgehoben:
durch großen Fettdruck: Größte Monatswerte sowie größte Tagesmengen von 50 mm und mehr;
durch kleinen Fettdruck: Kleinste Monatswerte;
durch kursiven Druck: Unsichere oder ganz bzw. teilweise ergänzte Werte.

**V. Tagesmengen von 50 mm und mehr.**

Die Zusammenstellung enthält sämtliche Tagesmengen von 50 mm und mehr. Hier erscheinen also alle Stationen, bei denen die größte Tagesmenge in den vorhergehenden Tabellen fett gedruckt ist.

**Stark- und Dauerregen.**

Als Starkregen werden alle Regenfälle oberhalb der Grenze $h = \sqrt{5\,t - \left(\frac{t}{24}\right)^2}$ gerechnet; h = Regenhöhe in mm, t = Regendauer in min. Die Mindestmengen für Starkregen ergeben sich sodann entsprechend der folgenden Tabelle:

| Regendauer (min) | 5 | 10 | 15 | 20 | 30 | 45 | 60 |
|---|---|---|---|---|---|---|---|
| Mindestmenge (mm) | 5.0 | 7.1 | 8.7 | 10.0 | 12.2 | 14.9 | 17.1 |
| Regendauer (Std.) | 1½ | 2 | 3 | 4 | 5 | 10 | 20 |
| Mindestmenge (mm) | 20.9 | 24.0 | 29.0 | 33.2 | 36.6 | 48.7 | 59.3 |

Unter Dauerregen sind alle Regenfälle zu verstehen, die bei einer ununterbrochenen Dauer von mindestens 6 Stunden eine Stundenintensität von mehr als 0.5 mm aufweisen.

Bei den mit einem Stern (*) bezeichneten Stationen sind aber nur die Dauerregen berücksichtigt, die bei einer ununterbrochenen Dauer von 6 Stunden und mehr eine Stundenintensität von mehr als 1 mm/Stunde aufweisen.

Zur Messung der Niederschläge, die früh 7 Uhr vorgenommen wird, dient fast allgemein der Regenmesser System Hellmann Mod. 86 mit einer Auffangfläche von 200 qcm, deren Höhe über dem Erdboden 1 m beträgt. An den Stationen höherer Gebirgslagen ist der Hellmannsche Gebirgsregenmesser im Gebrauch; seine 500 qcm große Auffangfläche befindet sich 2 m über dem Erdboden. Der registrierende Regenmesser System Hellmann hat die gleiche Auffangfläche von 200 qcm wie der gewöhnliche Stationsregenmesser.

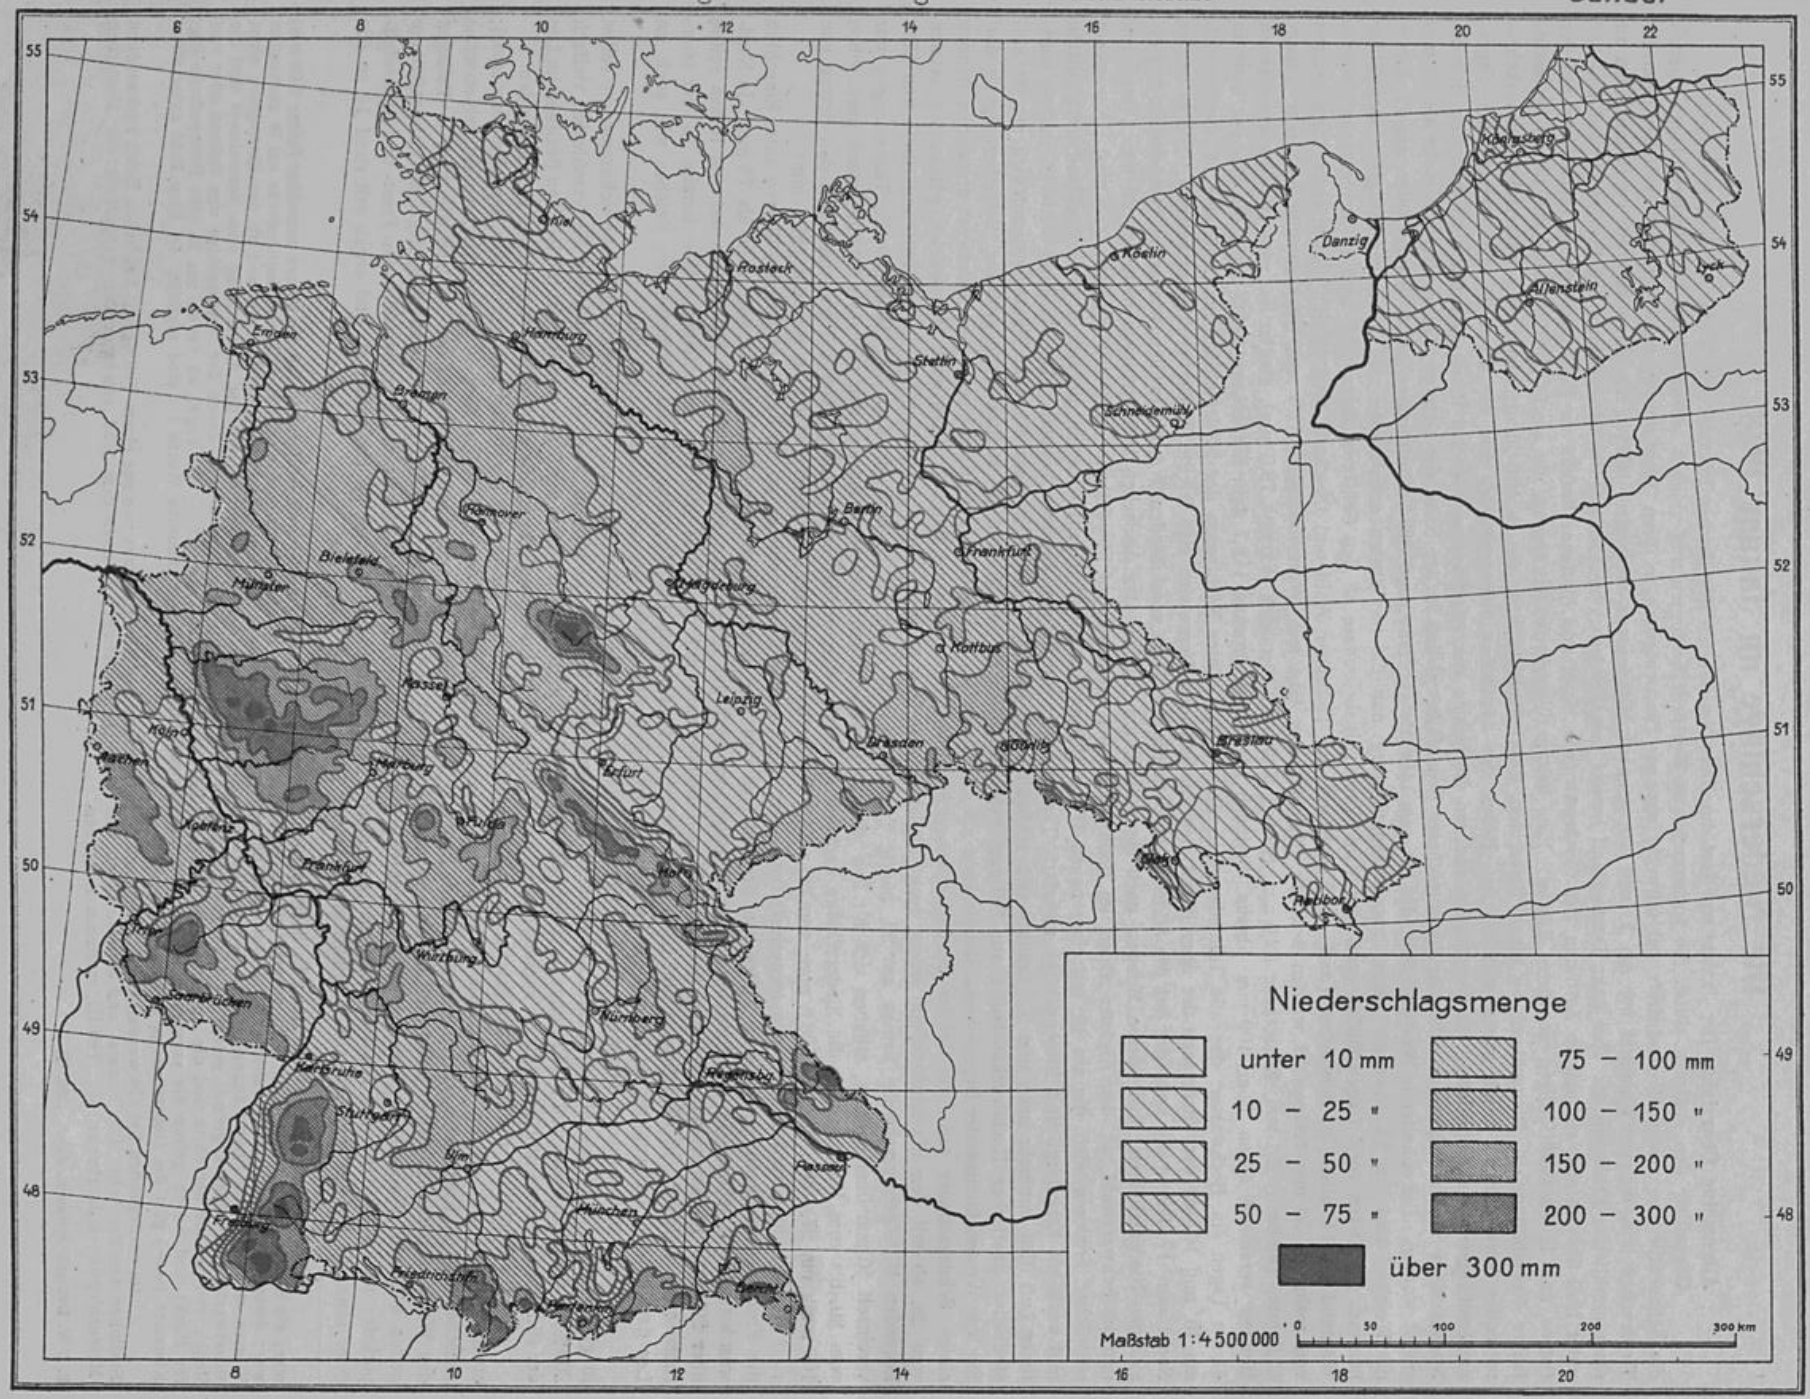
# Die Niederschläge im Januar 1938.

**Allgemeine Übersicht:** Der Januar war fast durchweg, im Westen des Reiches im stärkeren Maße, zu niederschlagsreich.

Gegenüber den späteren, durch die vorherrschende Westdrift bedingten und vielfach außergewöhnlichen Niederschlägen blieben die Schneefälle des ersten Monatsdrittels bei teilweise strenger Frostwitterung in ihren Tagesmengen meist innerhalb mäßiger Grenzen. Tiefdruckgebiete, die von Finnland her am 1. und am 4. nach Mitteleuropa vorstießen, führten mit ihren verbreiteten Schneefällen zu einer merklichen Erhöhung der über ganz Deutschland bereits bestehenden Schneedecke. Die Verschärfung des Frostes bis auf 12—14° unter Null äußerte sich vielfach im Zufrieren von Gewässern (wie Mosel und Lindauer Hafen), im Entstehen von Treibeisfeldern auf der Ostsee und in Packeisbildungen an ihren Küsten. Eine heftige Westnordwestströmung, die am 6. plötzlich einsetzte, führte bei mehrfacher Nebelbildung in Deutschland zu einer Reihe von Aufgleitschneefällen, die in Mitteldeutschland und Ostpreußen zu verkehrsstörenden Verwehungen Anlaß gaben und auf den Höhen des nördlichen Schwarzwaldes und der Alpen 25 mm übersteigende Tagesniederschlagsmengen hinterließen. In Westdeutschland, wo die milden Meeresluftmassen zunächst Raum gewannen, wiederholten sich die Niederschläge in den Folgetagen schon in Form reicherer Regenfälle, so daß in der Nähe der Gebirge Tageswerte von mehr als 20 mm erzielt wurden. Die anhaltende Westwinddrift, die langsam ostwärts vordrang, und die Kaltluftmassen am 9. bis zur Oder, am 12. hinter die Weichsel und am 13. über die Memel zurückdrängte, trug nun die im Westen anhaltenden und intensiven Aufgleitniederschläge langsam gen Osten vor. Ungewöhnlich groß waren im Westen, insbesondere an den Gebirgen, die am 13. und 14. gemessenen Mengen. Während am 14. allein im Bergischen Land, am Vogelsberg, am Thüringer Wald und Oberharz, auch in der Westprignitz Tagesmengen von mehr als 50 mm festgestellt werden konnten (Meinerzhagen 60,4 mm, Wermelskirchen 61,9 mm, Hückeswagen 61,2 mm, Tabarz 65,2 mm, Tambach 62,1 mm, Königskrug 62,0 mm, Schluft 63,4 mm, Wendisch-Warnow 73,0 mm), gingen die vom 10.—14. gemessenen Mengen vereinzelt schon über 100 mm hinaus (Steinach 121,7 mm, Brocken 118,7 mm, Königskrug 141,2 mm); die Wupper hatte in diesen Tagen ein Hochwasser, das alle Talniederungen überflutete. Unter Nachlassen der Niederschläge im Laufe des 14. machte sich eine leichte Wetterberuhigung geltend. Schon in der Nacht zum 17. leitete die erste der auf der Südseite nordatlantischer Tiefs vorstoßenden Warmluftwellen wieder zu verbreiteten und ergiebigen Niederschlägen über, deren Mengen nach Messungen am 18. an den deutschen Mittelgebirgen mehrfach 20 mm überstiegen und im Schwarzwald, an den Algäuer Alpen, im Böhmerwald sich mehrfach auf 30—50 mm steigerten (Segeten 56,6 mm). Nur wenig schwächer erwiesen sich die am 19. mit einer neuen Warmluftfront auftretenden Aufgleitregen, die sich über Deutschland fortpflanzten und auch am Erzgebirge und Riesengebirge mehrfach Tagesmengen von 25 mm absetzen konnten. Die Wirkung weiterer Staffeln maritimer Luft ließ nunmehr nach und beschränkte sich schließlich auf Norddeutschland, je mehr ein über Süddeutschland sich am 20. einstellender azorischer Hochdruckausläufer zur Geltung gelangte; lediglich der 25. und 26. stellten Tage größerer Wetterberuhigung dar. Ein von Westen kommender Depressionsausläufer löste am 27., besonders in Westdeutschland, mit seinen auf Nordwest drehenden Winden vom 28. ab mit den Warmluftstaffeln erneut recht niederschlagsreiche Aufgleitregen ein. Namentlich an der zwischen Rhein und Elbe liegenden Mittelgebirgsschwelle kamen am 29. häufig Tageswerte von mehr als 30 mm zur Messung. Während die Tagesmengen nur vereinzelt 50 mm überschritten, ergaben sich für den 29. und 30. zusammen wiederholt Beträge von mehr als 50 mm; wenn auch schon vom 30. bis zum Monatsschluß die Niederschläge nachließen, so überstiegen die Gesamtmengen von 4 Tagen mehrfach den Betrag von 100 mm (vom 27.—30.: Brocken 106,8 mm; vom 28.—31.: Furtwangen 118,0 mm, Villingen 114,9 mm, Segeten 126,7 mm).

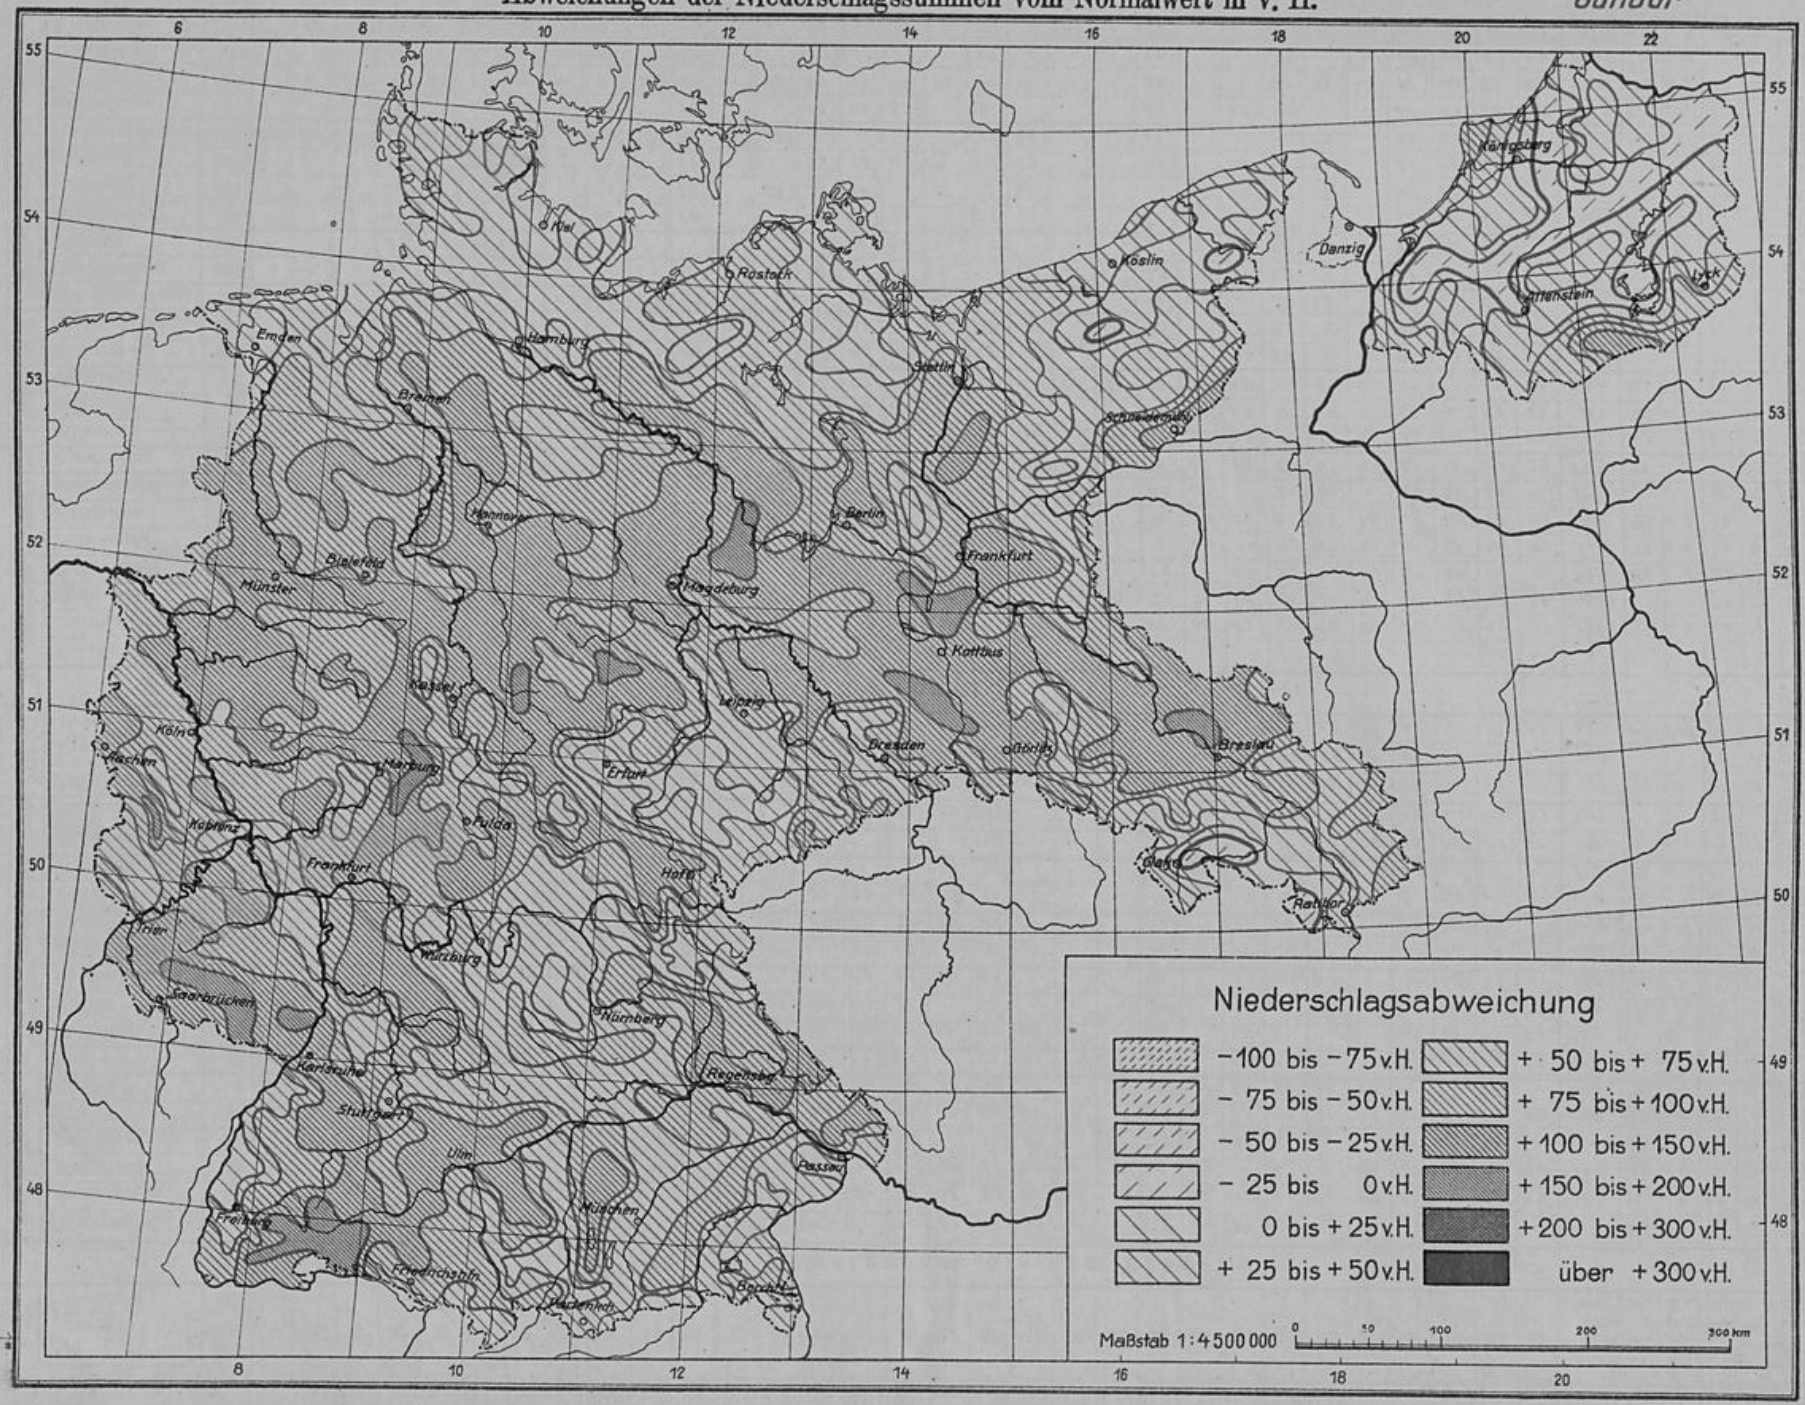
Sieht man zunächst von den leegeschützten Lagen und von den Küstengebieten ab, so hatte der gesamte Westen unter Einschluß des Freistaates Sachsen, des größten Teiles von Brandenburg und von Niederschlesien eine Monatsmenge von mehr als 75 mm. In Nordwestdeutschland, ebenso in der Umgebung aller Mittelgebirge und der Alpen ging sie über 100 mm hinaus, um auf den Höhen selbst über 200 mm, im Sauerland, Oberharz, Schwarzwald und Böhmerwald auf mehr als 300 mm anzusteigen. Wie bereits in der oberrheinischen Tiefebene, in Rheinhessen und in der thüringischen Senke fielen die Monatsbeträge im Nordosten des Reiches wie auch im Lee der Sudeten auf weniger als 50 mm, in Ostpreußen vereinzelt und strichweise auf weniger als 25 mm.



Mit wenigen Ausnahmen wurde das langjährige Niederschlagsmittel stark überschritten. Die prozentischen Abweichungen, die selbst in gleichartigen Gebieten jäh schwankten, überstiegen im Westen des Reiches bis hin zur Prignitz, Neumark und Niederschlesien vielfach 200%, in der Oberlausitz und am Riesengebirge teilweise 300%. Nicht ganz erreicht wurde der Durchschnittswert in kleineren Bezirken im Lee der südlichen Sudeten und im östlichen Pommern, ferner in Ostpreußen in einem parallel zur Küste verlaufenden mittleren Gebietsstreifen.

Die Häufigkeit der Niederschlagstage schwankte größtenteils zwischen 25 und 29 Tagen und war fast um das Doppelte übernormal; etwas geringer war sie im Schutze der Sudeten und in der nördlichen Grenzmark, besonders aber in Ostpreußen, wo sie gebietsweise zwischen 17—20 Niederschlagstagen wechselte. Die Zahl der Tage mit Schneefall, die im Klimabereich der Nordsee wie auch in Tallagen des Westens unter 10 blieb, belief sich im allgemeinen auf 12—13, sodaß ungefähr die Hälfte der Niederschlagstage als Schneefalltage gelten konnten. Die Andauer einer Schneedecke unterlag stark der Auswirkung der zu Monatsanfang vorherrschenden Frost- und Schneefallperiode; sie umfaßte an der litauischen Grenze den ganzen Monat, nahm auf 7 Tage im Emsgebiet ab und ergab mit rund 14 an der Oder etwa die für das westdeutsche Bergland anzusetzende Dauer einer Schneedecke.

---



**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊠) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (⊹) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um $7^h$ eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⌣) gibt die Gesamtmenge mehrerer Tage.

Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.

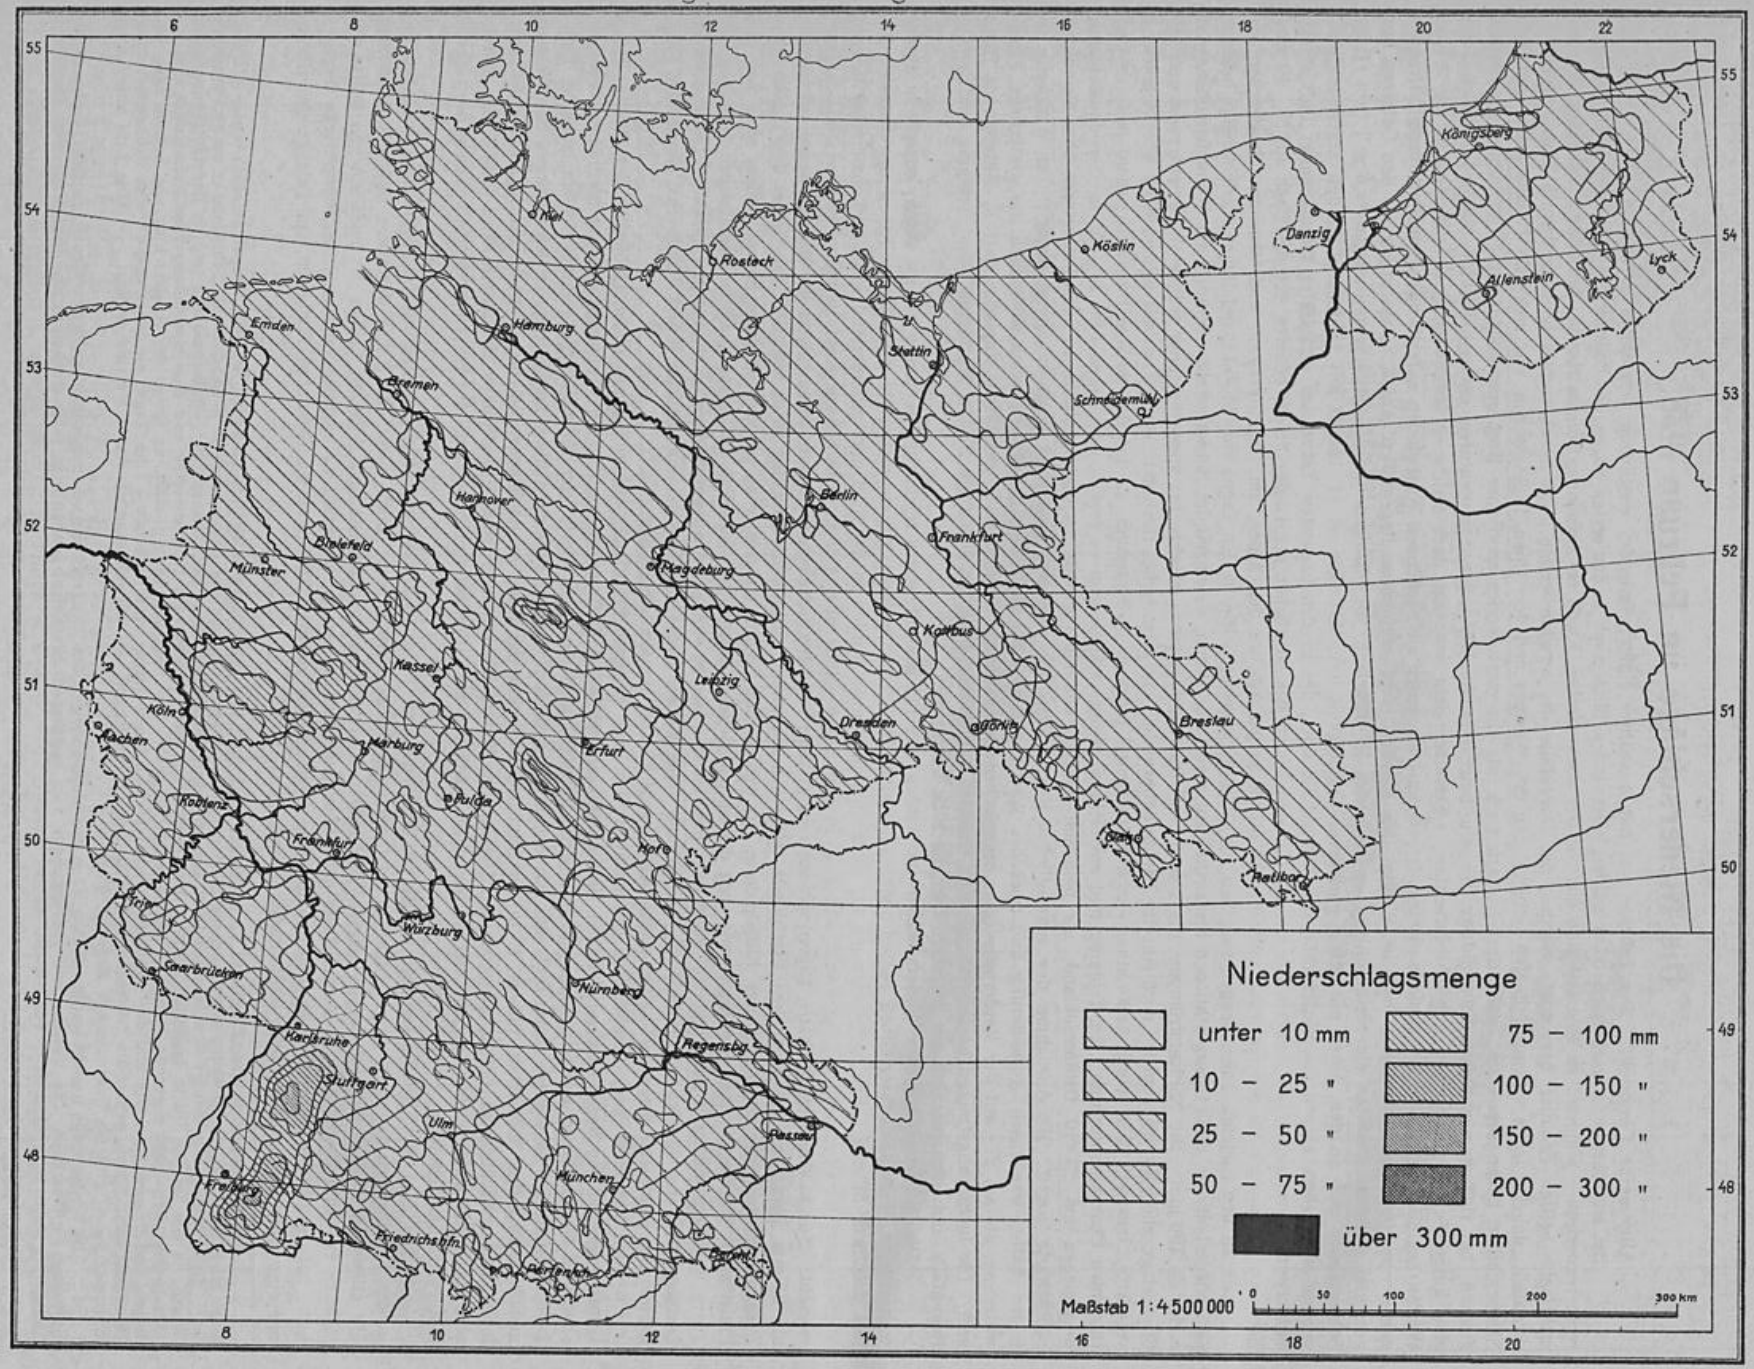
# Die Niederschläge im Februar 1938.

**Allgemeine Übersicht:** Der Februar war mit Ausnahme einiger Teile des westlichen Berglandes zu trocken.

Bei zunächst noch vorherrschenden milden Westwinden blieb auch in den ersten Tagen des Februar die Witterung in Deutschland recht regnerisch. Während zu Monatsbeginn ein vor der norwegischen Küste erscheinender Sturmwirbel bei zeitweise stürmischen Winden mehrfache heftige Schauer hervorrief, wurden die Regenfälle der anschließenden Tage durch mehrfache ausgedehnte Warmluftstaffeln veranlaßt; dabei wurden vereinzelt in den Gebirgslagen des Westens und der Alpen Tagesmengen von mehr als 10 mm gemessen. Die Niederschläge ließen schon im Laufe des 4. stark nach, als ein vorstoßender azorischer Hochdruckausläufer in Mitteleuropa an Einfluß gewann; bei vielfach nächtlicher Nebelbildung, die ein langsames Abgleiten der Temperaturen mit sich brachte, folgte für einige Tage eine kurze Schönwetterperiode ohne Niederschlag. Gegenüber dem langsam nach Osten abrückenden Hoch näherte sich am 9. von Westen her ein Ausläufer einer nordatlantischen Depression; die unter auffrischenden Westwinden aufziehenden feuchten Warmluftfronten gaben vom 9. ab zu verbreiteten und im Westen des Reiches recht ergiebigen Regenfällen Anlaß. Namentlich an den Gebirgen des gesamten Westens brachten die Niederschläge im Laufe des 10. mehrfach Tagesmengen von 40—50 mm und setzten sich z. T. am 11. im Schwarzwald und an den Alpen mit etwas geringerer Ergiebigkeit fort. Da sich am 11. bereits mit nördlichen Winden arktische Luftmassen einschoben, gingen die Niederschläge in Schneefälle über, die in den folgenden Tagen bei verstärkter Zufuhr kalter Luft starke Verbreitung gewannen. Die Mengen, die am 12. auf den Höhen des westlichen Berglandes fielen, beliefen sich mehrfach auf 25—40 mm. Noch am 14. wurden im Schwarzwald, und auf der schwäbischen Alb, an den Alpen, am Thüringerwald und Oberharz, desgleichen am 15. noch an den Sudeten Tagesmengen zwischen 15—30 mm gemessen. Die in den Tagen vom 11.—14. gefallenen Niederschläge beliefen sich wiederholt an den Gebirgsstationen insgesamt auf mehr als 70 mm, vereinzelt im Schwarzwald wie auch am Wendelsteinhaus auf mehr als 100 mm. Die Nordostströmung, die vom 14. ab Oberhand gewann, brachte bei ausgesprochner trüber Winterwitterung und bei Schneelage zunächst bis zum 16. noch einzelne leichte Schneefälle; ein atlantisches Hoch, das vom 15. ab mit seinem Kern über Schottland verharrte, bewirkte mit seiner Ausbreitung nach Mitteleuropa langsam Aufheiterung, so daß das mäßige Frostwetter bald heiteren und trockenen Charakter annahm. Zu Trübung und zu leichten Niederschlägen kam es erst in den Tagen vom 20.—22. in Norddeutschland, desgleichen am 23. in Ostdeutschland, als beidemal stärkere und umfangreiche Depressionsstörungen vom Polargebiet über Osteuropa südostwärts zogen. Mit Ausnahme der nordöstlichen Reichshälfte, die zunächst noch stark unter anhaltend diesig-trüber Witterung zu leiden hatte, war rasch Aufheiterung und trockenes Wetter gefolgt. Bei steigender Erwärmung wich schließlich die winterliche Frostwitterung, als am 27. auf der Vorderseite einer ozeanischen Druckstörung wärmere z. T. gemäßigte tropische Luft in Mitteleuropa Platz griff. Die in Störungsfronten herangeführten mild-feuchten Luftmassen brachten schon am 27. in Westdeutschland Trübung und leichte Regenfälle und pflanzten sich am 28. noch über die Elbe hinaus fort.

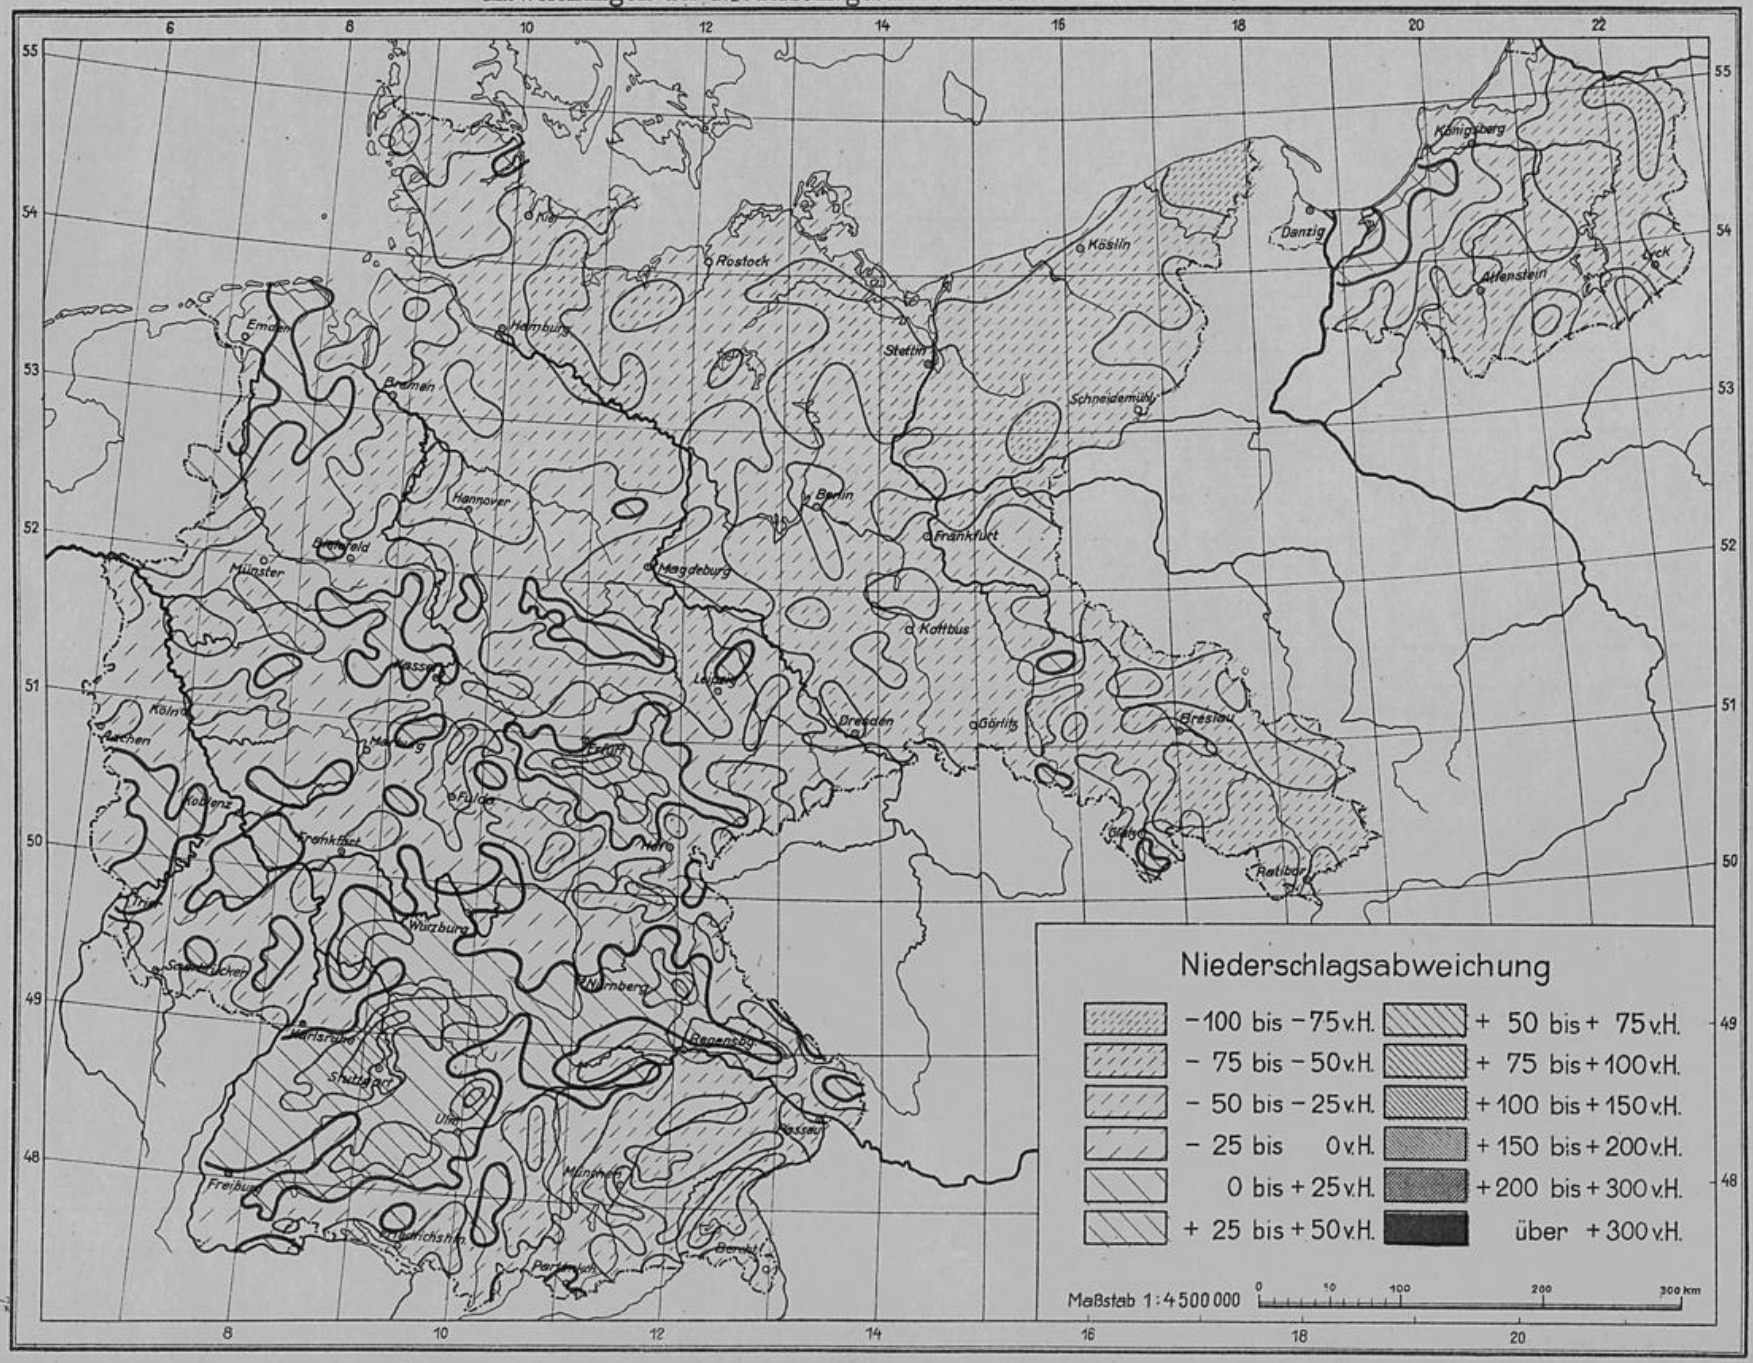
Die Niederschläge des Monats waren im Westen des Reiches allgemein reichlicher bemessen als im Osten; entsprechend der winterlichen Niederschlagsverteilung hatten auch die Gebirge im Westen größere Monatsbeträge als die höheren Lagen des Ostens. Bei fast durchweg 50 mm hohen Monatsmengen im westlichen Berglande wurden in der Eifel und im Sauerland sowie im Böhmerwald Mengen über 75 mm, im Oberharz, Thüringerwald und z. T. in den Alpen solche über 100 mm, im Schwarzwald Mengen zwischen 150—200 mm erreicht. Nur in den leegeschützten Lagen, wie auch im größten Teile des bayerischen Donaubeckens gingen die Monatsbeträge auf weniger als 25 mm herunter. Im westlichen Flachlande mit sonst angenähert 50 mm Niederschlag fielen lediglich das Gebiet des Weser-Aller-Zusammenflusses, wie auch das der Elbmündung mit weniger als 25 mm als relativ zu niederschlagsarm heraus. Sieht man von den Freistaaten Thüringen und Sachsen sowie von der anschließenden Lausitz ab, so zeigte der gesamte Osten des Reiches etwa von der Trave und dem mittleren Elbgebiet ab durchweg mit weniger als 25 mm einen ausgesprochen zu trockenen Charakter; Landesteile im Lee der südlichen Sudeten, ein Gebiet von der unteren Oder bis zur Netze hinüber, der nordöstliche Bezirk Pommerns, sowie die Flußgebiete der Pissa und Angerapp hatten noch nicht einmal 10 mm Monatsniederschlag.



Im Vergleich zum langjährigen Durchschnitt war das gesamte Flachland, abgesehen von einem Gebiet an der Ems und von Landstrichen an der Nogat und am Frischen Haff zu trocken geblieben. In Pommern und in der Grenzmark mit der nördlichen Neumark, ebenso in Oberschlesien waren weniger als die Hälfte, teilweise noch nicht ein Viertel der Normalmenge gefallen. Wenn auch im Berglande vielfach im Leeschutze kaum 50% des Durchschnittes gemessen wurden, so stiegen die Monatsbeträge an den Gebirgen des Westens mehrfach über den Normalwert hinaus, so in der Eifel, am Hunsrück, im Harz, am Thüringerwald, ferner strichweise im Hessischen Berglande und schließlich in einem ausgedehnten Gebiet, das Baden, Württemberg und Mittelfranken umfaßte. Etwa 150% des Durchschnitts hatten kleinere Bezirke am Oberlauf der Gera und Ilm, am Mittellauf der Naab, auf der Schwäbischen Alb, sowie die Gegend von Pforzheim-Heilbronn.

Die Zahl der Niederschlagstage war selbst im Westen mit 13 bis 14 etwas zu gering und erreichte im bayerischen Donaubecken, in der Thüringermulde, sowie verschiedentlich im Osten des Reiches mit 6 bis 7 noch nicht die Hälfte der sonst üblichen Häufigkeit. Mit allgemein 5 bis 8 Schneefalltagen [zeigten] sich keinerlei Gegensätze zwischen Ost und West, so daß in der nordöstlichen Hälfte des Reiches ein Ausfall von 3 bis 4 solcher Tage gegenüber dem landläufigen Durchschnitt zu verzeichnen war. Die Schneedecke dagegen hatte naturgemäß in Ostpreußen einen etwas längeren Bestand, bis zu etwa 19 Tagen im äußersten Nordosten, im Talzuge des Rheins nur eine zwischen 3 bis 8 Tagen wechselnde Andauer.

---



**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um 7h vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊠) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (✳) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um 7h eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⌣) gibt die Gesamtmenge mehrerer Tage.

Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.

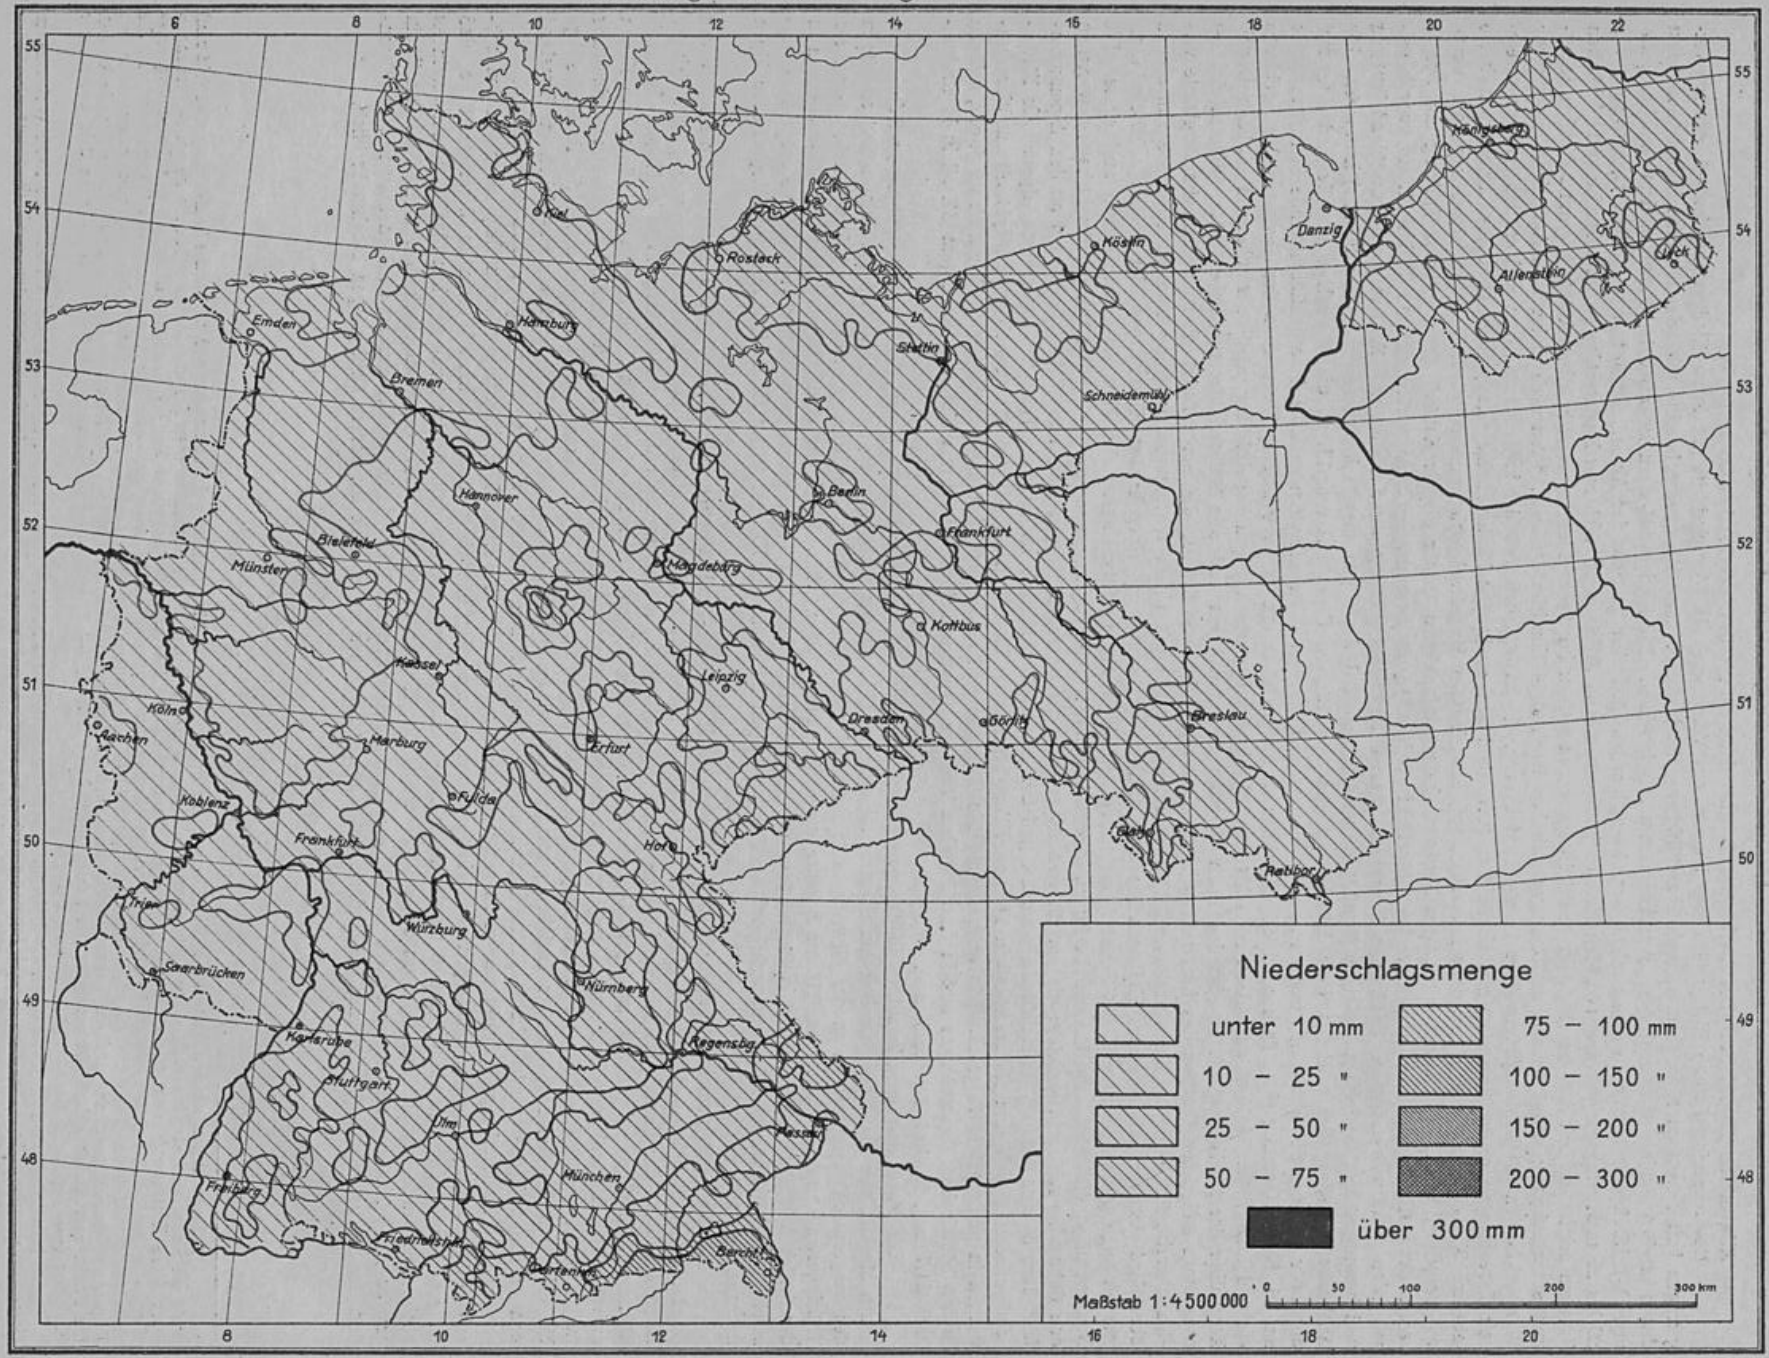
# Die Niederschläge im März 1938.

**Allgemeine Übersicht:** Der März war mit Ausnahme einiger östlicher Landesteile zu trocken.

Das regnerische trübe Wetter, das seit dem 26. des Vormonats die Westwinddrift mit ihren Niederschlagsfronten ostwärts vorgetragen hatte, kam zu Monatsbeginn auch über Süddeutschland stärker zur Geltung und brachte mit seinen milden Luftmassen die in den deutschen Gebirgen vorhandenen Schneelagen zum Abschmelzen. Die Niederschläge zu Monatsbeginn fielen an dem östlichen pommersch-baltischen Höhenrücken etwas reichlicher, besonders reichlich aber im Stau der Alpen, sodaß hier wiederholt Tagesmengen von 20 bis 25 mm gemessen wurden (Wendelsteinhaus hatte am 2. und 3. insgesamt 59.5 mm Niederschlag). Im teilweise recht lebhaften Zustrom arktischer Luft auf der Rückseite der Störungsfronten folgten im Wechsel mit zeitweise kräftiger Aufklarung am 2. häufige Regen- und Schneeschauer; selbst als sich am 3. ein atlantisches Hoch dem Kontinent näherte, liefen noch einige zum Aufsteigen gezwungene Warmluftfronten mit Niederschlägen über Deutschland hinweg, die im östlichen Teil der bayerischen Alpen und an den Sudeten vereinzelt Tagesmengen von mehr als 20 mm hinterließen (Grunwald 54.9 mm). Die Niederschläge setzten bald ganz aus, als vom 3. ab die lebhafte Weströmung von einem über Frankreich sich einstellenden Hochdruckgebiet genährt wurde. Die Schönwetterperiode wurde vorübergehend am 7. bei der mit zeitweiligen Nordwestwinden verbundenen Zufuhr frischer Kaltluft durch stärkere Trübung und Sprühregen namentlich am Rande der deutschen Mittelgebirgsschwelle unterbrochen. Stärker wirkte sich am 9. bis 11. ein über Mittelschweden ostwärts wandernder Tiefdruckausläufer aus, dessen Rückseitenströmung aus Nordwest und Nord in ganz Deutschland Trübung und besonders an den Gebirgen stärkere Regenfälle (im östlichen Teil der Alpen mehrfach Tagesmengen über 20 mm) hervorrief. Die Ausbreitung des westlichen Hochs über Mitteleuropa gab vom 12., im Osten erst vom 14. ab die Grundlage zum Bestand eines fast durchweg bis zum 25. währenden trockenen, recht warmen und heiteren Witterungscharakters. Leichte vorübergehende Störungen traten am 16. bei Verlagerung eines flachen schottischen Tiefs nach der Ostsee mit Trübung und Sprühregen an den deutschen Mittelgebirgen ein und hinterließen in Norddeutschland noch bis zum 19. die Neigung zur häufigen Nebelbildung, sowie zur anhaltend stärkerer Bewölkung über der Nordsee. Nachdem sich das Hoch langsam nach den Alpen und zum Balkangebiet verschoben hatte, bildeten sich bei neuerdings steigender Tendenz des Luftdruckes in Mitteleuropa örtliche Störungen, die am 22. und 23. namentlich im Berglande vereinzelt geringfügige Niederschläge auslösten. Erst vom 25. ab setzte mit einem Witterungsumschwung eine Regenperiode ein, als ein über Nordschweden auftauchendes Tief nach Finnland sich verlagerte und mit einer breiten Kaltluftfront, der weitere arktische Luftmassen folgten, stärkere Regen- und Schneefälle, die schließlich in Schauer übergingen, sich über ganz Deutschland ausbreitete. Die Niederschläge, die schon zum Morgen des 26. in Westdeutschland vereinzelt Tagesmengen von 15 bis 20 mm gebracht hatten, waren an den Gebirgshängen recht ergiebig; die am 27. und 28. insgesamt gemessenen Mengen gingen am Schwarzwald und an den Alpen mehrfach über 50 mm hinaus, desgleichen die am 28. und 29. festgestellten Mengen im östlichen Teile der bayerischen Alpen. Die Niederschläge setzten sich zum Monatsschluß in Form von Aufgleitniederschlägen fort, als mit dem 29. von einem Biskayahoch aus Warmluftfronten in unablässiger Folge ostwärts vordrangen. Die Tagesmengen, die an den Erhebungen vielfach über 15 mm hinausgingen, nahmen in den böhmischen Randgebirgen und in dem östlichen Teil der Alpen mehrfach auf 30 mm und darüber zu (am 31. allein in Grattenbach 51.7 mm, in Groß-Iser 58.5 mm).

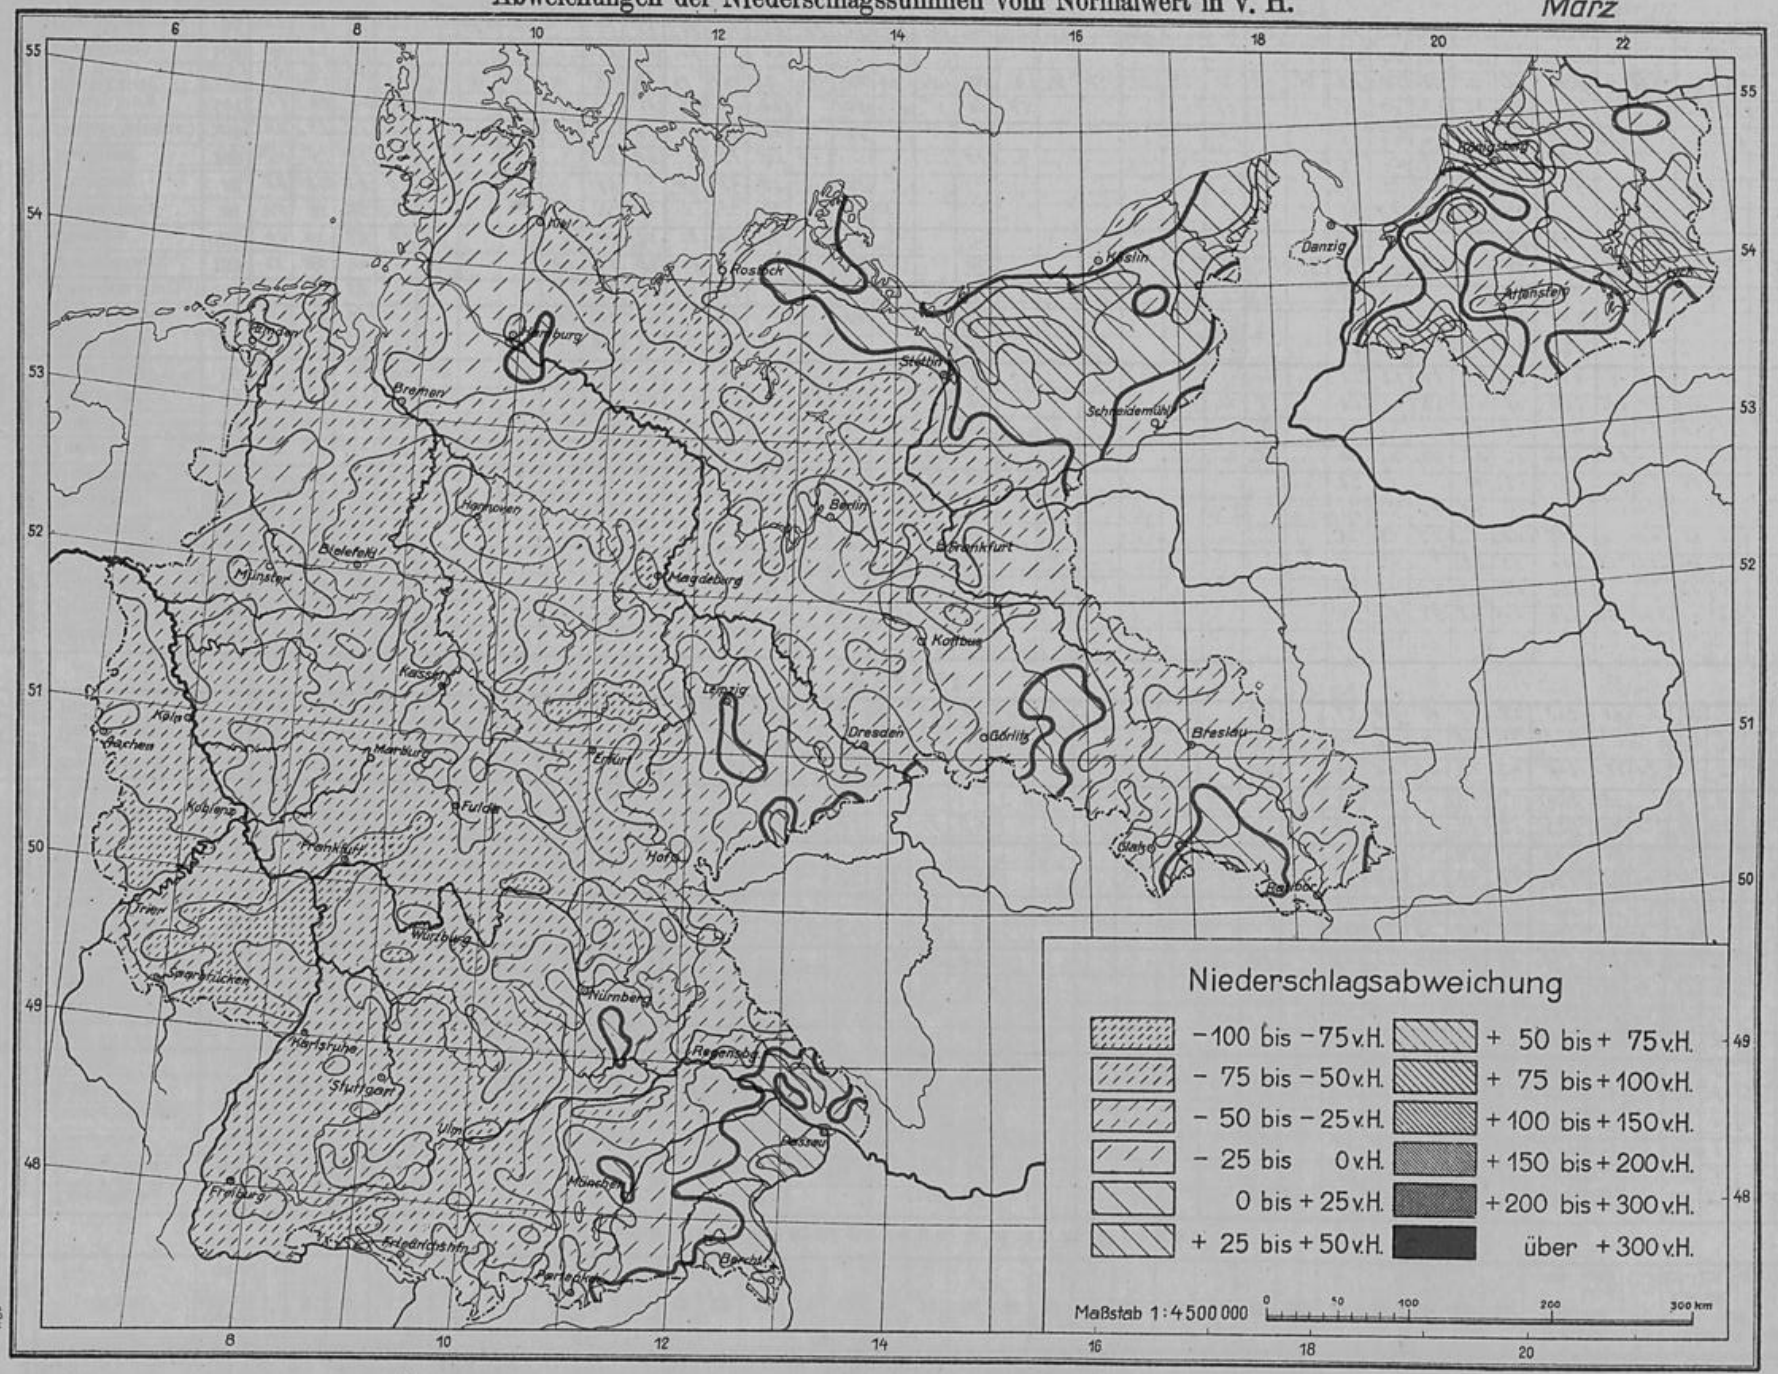
Die Monatsbeträge schwankten in der westlichen Hälfte des Reiches unter Einschluß von Franken, Brandenburg und dem westlichen Mecklenburg mehr oder weniger um 25 mm; sie nahmen z. T. an den Mittelgebirgen auf mehr als 50 mm zu, um andererseits in den ausgesprochenen Leelagen an der Eifel, am Hunsrück und pfälzischen Bergland, am Taunus, an der schwäbischen Alb, ebenso am Thüringerwald und am Harz unter 10 mm herunterzugehen. Etwas größer, vielfach mit mehr als 50 mm waren die Monatsmengen in der östlichen Hälfte Pommerns und in Ostpreußen, desgleichen in den östlichen Teilen Ober- und Niederbayerns. Die größten Beträge erreichten der Oberharz, der Böhmerwald und die Allgäuer Alpen mit mehr als 75 mm, ferner die östliche Hälfte der bayerischen Alpen mit mehr als 100 mm.



Im Vergleich zum langjährigen Durchschnitt war damit in West- und Mitteldeutschland größtenteils noch nicht die Hälfte der sonst üblichen Menge gefallen, sogar noch nicht ein Viertel in Teilen der Eifel, des pfälzischen und hessischen Berglandes, im Thüringer Hügelland längs der Unstrut, in der Magdeburger Börde, in Ostfriesland, ebenso im Bauland, an den Haßbergen und im Hegau. Schwach übernormale Beträge zeigten sich zunächst in vereinzelten kleineren Gebieten in der Umgebung von Hamburg, an den fränkischen Höhen zwischen der Altmühl und der Pegnitz, am Dachauer Moos sowie im sächsischen und schlesischen Berglande; in größerer Verbreitung traten sie erst im östlichen Ober- und Niederbayern, in Pommern und Ostpreußen in Erscheinung. Hier steigerten sich die Prozentbeträge bis auf 150% des Durchschnittes am östlichen pommerschen und am ostpreußischen-baltischen Höhenrücken, desgleichen im Ermeland und im Samland, dessen nördliche Steilküste ebenso wie die Seesker Höhen teilweise 175% der Normalmenge noch überschritten.

Die Niederschlagshäufigkeit war meist recht gering; sie entsprach mit etwa 15 Niederschlagstagen in Ostpreußen, in den böhmischen Randgebirgen und in den Alpen noch einigermaßen der normalen Häufigkeit und sank nach Westen zu derart rasch ab, daß im gesamten Rheingebiet vielfach nur 6 bis 9 solcher Tage gezählt wurden. Schneefall, der im nordwestlichen Flachlande nur vereinzelt beobachtet wurde, trat in Ostpreußen an 6 bis 8 Tagen ein, eine Häufigkeit, die in den Gebirgen etwa oberhalb 600 bis 700 m, am Rhein erst oberhalb 1000 m erreicht wurde; zur Ausbildung einer vorübergehenden Schneedecke kam es nur an wenigen Stationen des Ostens und der oberbayerischen Hochebene, während sie mit längerer Ausdauer schon stark auf höhere Gebirgslagen beschränkt blieb.

---



**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊗) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (⊗) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um $7^h$ eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⌣) gibt die Gesamtmenge mehrerer Tage.

Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.

# Die Niederschläge im April 1938.

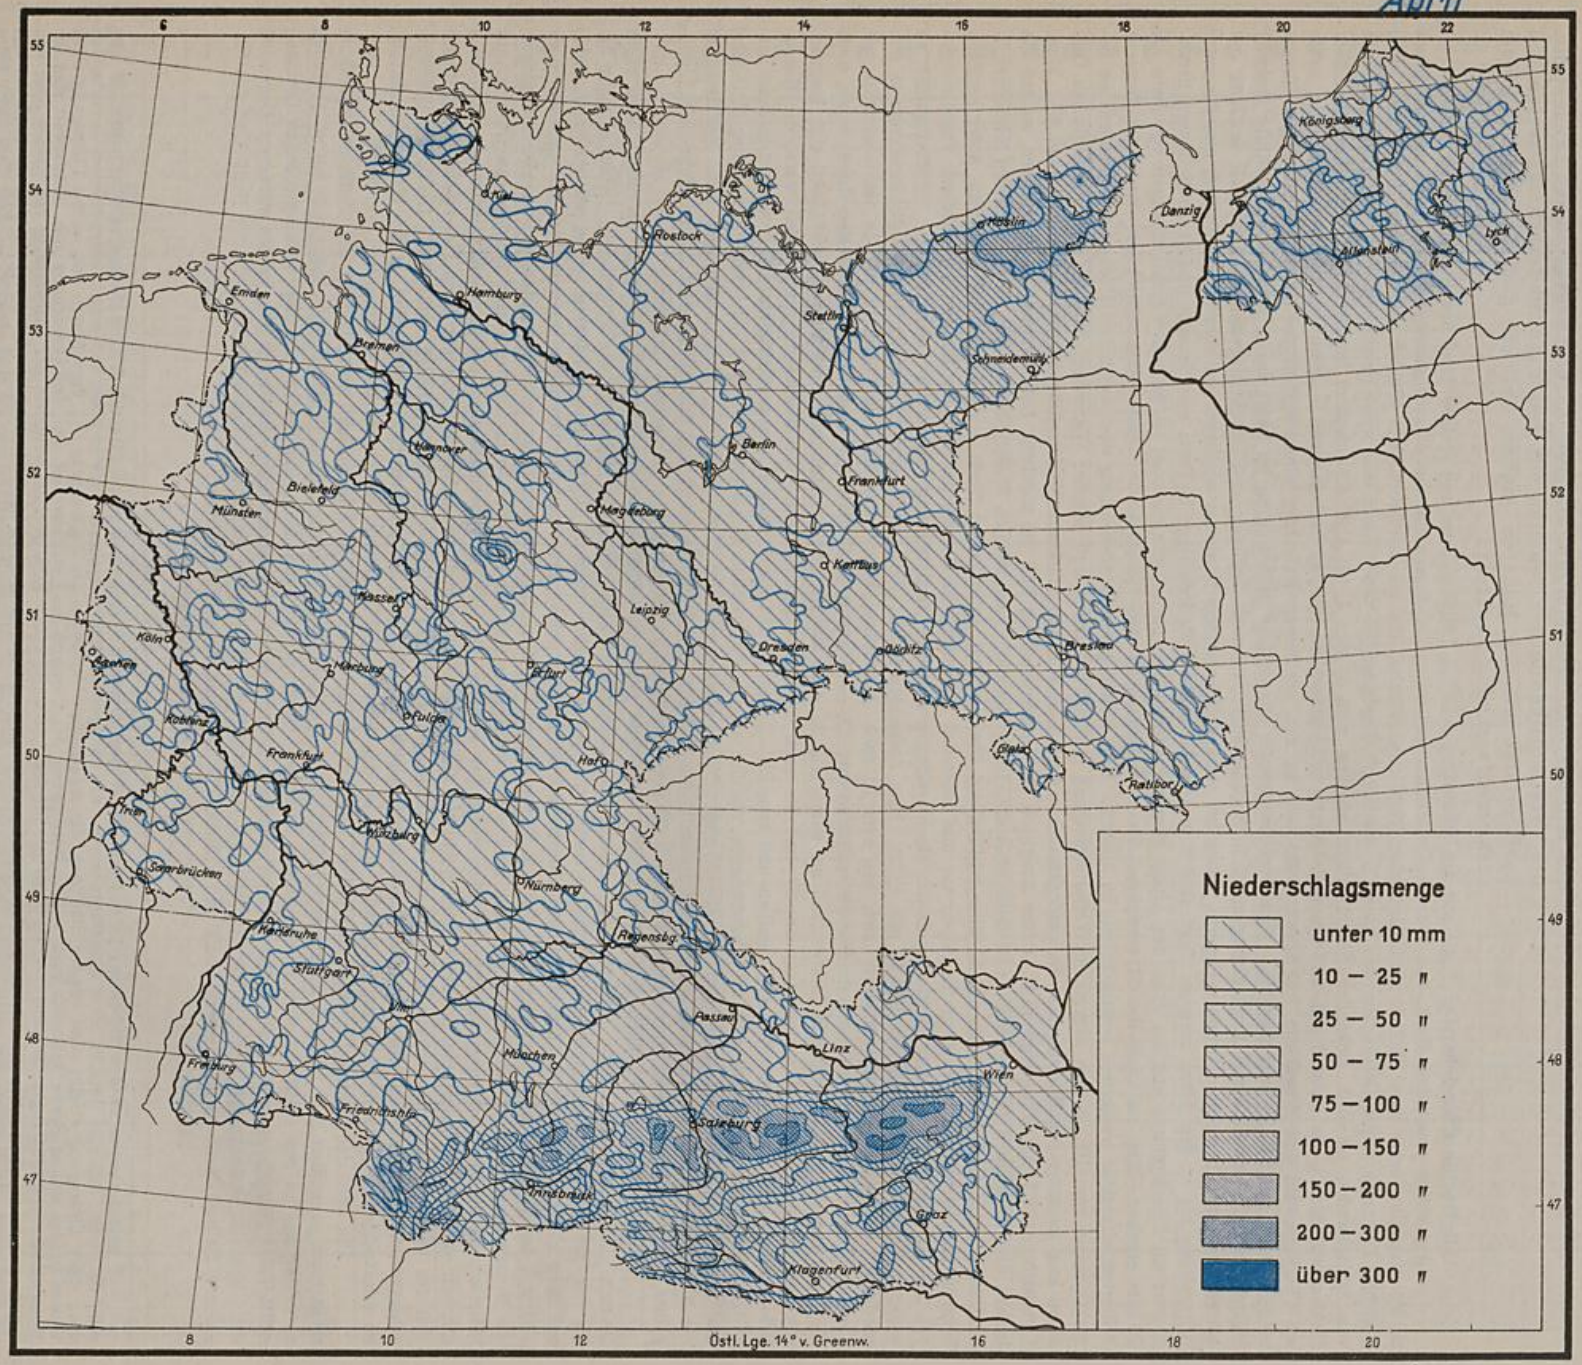
Der Bericht umfaßt erstmalig im Text wie in der Kartendarstellung auch die mit der Wiedervereinigung Österreichs hinzugekommenen Landesteile. Die Veröffentlichung der Tabellen mit den Tagesniederschlagswerten des April erfolgt mit den Monaten Januar, Februar und März 1938 in einem zusammenfassenden Nachtrag.

**Allgemeine Übersicht:** Der April war mit Ausnahme östlicher Landesgebiete und einiger Teile des Berglandes zu trocken.

Bei einem westlichen Hoch, das über Großbritannien und seinen Gewässern bis zum 23. vorherrschend blieb, lag Norddeutschland zu Monatsbeginn unter dem Einfluß nordatlantischer Tiefdruckausläufer, die bei nordwestlichen Winden mit häufigen Regenfällen dem östlichen Pommern, sowie Ostpreußen bis zum 3. wiederholt Tagesmengen von 15 mm und mehr bescherten. Auf der Rückseite eines von Südschweden ostwärts ziehenden Sturmwirbels brachen vom 3. zum 4. bei z. T. stürmischem Nordwestwind Kaltluftmassen über Deutschland herein, die unter Regen- und Graupelschauern und vereinzelten Gewitterscheinungen im Stau der Mittelgebirgsschwelle, sowie am Thüringerwald und Erzgebirge, am Schwarzwald und an den nördlichen Kalkalpen einschließlich der östlichen Zentralalpen Tagesniederschläge von 20—30 mm brachten. Nach vorübergehender allgemeiner Aufheiterung im Laufe des 4. veranlaßte die Zufuhr feuchter Meeresluft am Südrande einer Druckstörung am 5. in Norddeutschland erneut Trübung und leichte Regenfälle. Als am 7. das Tief von Mittelschweden sich weiter ostwärts verlagerte, setzte bei stark auffrischendem Nordwest wiederum ein Vorstoß von Kaltluft ein, der unter Ausbreitung bis zu den Alpen mehrere Tage anhielt und immer erneute Niederschläge in Form von Schnee- und Graupelschauern heranführte; am Riesengebirge und im Stau der Alpen gingen Niederschläge nieder, die bis zum 10. mehrfach Gesamtmengen von mehr als 50 mm ergaben. Erst im Laufe des 11. erreichten die Niederschläge in den Hochalpen ihr Ende, ohne südlich von ihnen den heiteren Witterungscharakter wesentlich beinträchtigen zu können. Die vorübergehende Ausbreitung des westlichen Hochs nach Mitteleuropa bewirkte schon vom 10. ab eine allgemeine Wetterberuhigung mit meist heiterer und warmer Witterung; lediglich an den nördlichen Ostalpen kam es unter der Wirkung von Balkandepressionen am 13. und 14. zu stärkeren Niederschlägen (gemessen am 14. und 15.: Vord. Langbathsee 52.3 mm, Feuerkogl 55.4). Unter Ausgleich der Druckverteilung ließ die nördliche Luftbewegung langsam nach, so daß die heitere und trockene Witterung in ganz Großdeutschland Geltung gewann. Nach leichten Niederschlägen am 16. im mittleren Norddeutschland stieß auf der Rückseite eines am 17. über Südfinnland überraschend auftretenden Tiefs arktische Kaltluft südwärts unter häufigen Schnee- und Graupelfällen bis über die Alpen vor und hinterließ namentlich im Bereich der Ostalpen für den 18. mehrfach Tagesmengen von 25—30 mm. Die aus dem großbritannischen Hoch weiterhin gespeiste Nordströmung führte im Laufe des 19. im Rheingebiet zu weiteren Tagesniederschlägen von 10—15 mm Höhe. Eine Balkandepression, die am 20. und 21. bereits stärkere Niederschläge in den nördlichen Kalkalpen auslöste, verlagerte sich bis zum 23. nach der Ostsee, wo die Regenfälle in Pommern und in der Grenzmark mit Tagesmengen von 30—40 mm besonders stark auftraten (am 23. Groß Jestin 41.4 mm). Abgesehen vom Nordwesten des Reiches, hielt die meist regnerische Witterung in Deutschland an, zumal am 24. eine feuchte Nordwestströmung einsetzte und schließlich eine langsam zur Entwicklung gelangte Adriadepression am 27. und 28. nach Ostdeutschland vorstieß. Von besonderer Ergiebigkeit waren die Regenfälle vom 24.—26. an den nördlichen Kalkalpen und vom 25.—27. im Gebiet der Ostalpen; die nordostwärts sich vorlagernde Zone verstärkter Regenintensität ergab zum 28. Tagesmengen von 50 mm im bayerischen Donaugebiet (Schlott 55.1 mm, Siegenburg 52.0 mm) und zum 29. im Riesengebirge Mengen von 25—30 mm. Nach vorübergehender Wetterbesserung wiederholten sich zum Monatsschluß die Niederschläge mit dem Vorstoß einer neuen Kaltluftfront in West- und Süddeutschland und hinterließen zum 30. im Ruhr- und Lippegebiet, sowie im Weser- und Werrabergland vielfach 30 mm übersteigende Tagesmengen (Lauterbach 50.4 mm).

Die Monatsbeträge blieben in größeren Teilen West- und Mitteldeutschlands bis zur Oder unter 25 mm, vereinzelt noch unter 10 mm. Verhältnismäßig mehr Niederschläge hatten die Landesteile östlich der Oder erhalten, wo in größeren Gebieten mehr als 75 mm, am östlichen pommerschen Höhenrücken sowie im Gebiet der Liebe mehr als 100 mm gefallen waren. Eine stetige Zunahme bis auf mehr als 75 mm zeigte das Erzgebirge, der Böhmerwald, der mittlere Schwarzwald und das bayerische Donaubecken, bis zu etwas über 100 mm das Rothaargebirge, der Oberharz und das Riesengebirge. In den Alpen, die durchweg reichlichere Mengen verzeichneten, gingen die Monatsmengen in den nördlichen Kalkalpen noch stellenweise über 200 mm hinaus. — Im Vergleich zum langjährigen Durchschnitt beliefen sich die Monatsmengen westlich der Oder meist auf weniger als 50% der Normalmenge; zu schwach übernormalen Beträgen erhoben sie sich am Unterrhein, an der Kölner Bucht, im Gebiet vom Rothaargebirge südostwärts bis zur Rhön, in einem ausgedehnten Teil des bayerischen Donaubeckens, ferner in den nördlichen Kalkalpen und im Grazer und Klagenfurter Talbecken. Der größere Niederschlagsreichtum östlich der Oder äußerte sich in Prozentbeträgen von 200%, die am pommerschen Höhenrücken, in der Weichselniederung, im ermländischen und samländischen Hügelland, sowie an den Seesker Höhen erreicht und vereinzelt überschritten wurden.

Die Zahl der Niederschlagstage war in Ost- und Mitteldeutschland, sowie im Alpenvorland einschließlich der nördlichen Kalkalpen recht hoch, gegenüber dem üblichen Normalwert vielfach um 4—6 solcher Tage; andererseits fiel die Niederschlagshäufigkeit mit 8—11 Tagen zu gering aus an den nordfriesischen Inseln, an der Saar, am Oberrhein und am Main, desgleichen in den ausgesprochenen Leelagen südlich der Zentralalpen. Fast die Hälfte dieser Tage waren Schneefalltage; ihre anteilmäßige Häufigkeit ging in den wärmeren Gegenden am Rhein, im Donaugebiet, sowie in Kärnten und Steiermark auf 30—25% herab, war aber in den höheren Lagen der Nord- und Zentralalpen auffallend hoch, so daß Feuerkogl 24 und Präbichl 27 Tage mit Schneefall zählten.



---

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊠) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (⊹) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um $7^h$ eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⌣) gibt die Gesamtmenge mehrerer Tage.

Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.
