Gegenüber dem Niederschlagsbericht, der vom April 1938 ab die mit der Wiedervereinigung Österreichs hinzugekommenen Landesteile berücksichtigt, beschränkt sich der vorliegende Schneedeckenbericht für April und Mai 1938 als den die Winterperiode 1937/38 abschließenden Monaten inhaltlich noch auf das Altreich.

# Die Schneedecke im April 1938.

**Allgemeine Übersicht:** Gegenüber einer dauernden Schneedecke, die sich am Schluß des zu warmen Vormonats nur auf Höhen über 1000 m in der östlichen Hälfte des Reiches sowie in den Alpen beschränkte, kam es während des durchweg zu kühlen April bei den sich wiederholenden Kaltlufteinbrüchen auch in tieferen Lagen zur Bildung einer kurz währenden Schneedecke. Die Schneefälle des 3. und 4. brachten in dieser Weise dem baltischen Höhenzuge östlich der Oder eine geringe Schneelage, ebenso den Hängen aller deutschen Gebirge im Westen etwa oberhalb 600 m, im Osten oberhalb rd. 300 m. Etwas weitere Verbreitung hatte die Neuschneedecke, die mit den Schneefällen des Kaltluftvorstoßes vom 7.—9. entstand und den pommerschen und ostpreußischen Höhenrücken und das Bergland bis zu Höhenschichten von 250 m im Osten und 600 m im Westen umfaßte; bei der Häufigkeit und Ergiebigkeit der Niederschläge erreichten die Neuschneeansammlungen vielfach in 700 m eine Mächtigkeit von 15—20 cm und in 850 m Seehöhe von 28—30 cm, in den Alpen sogar von 35—40 cm. Bei einem weiteren Kälteeinbruch, der zum Osterfest am 17. erfolgte und in Süddeutschland noch am 21. sich verstärkt auswirkte, kam es erneut zu einer schwachen Schneebedeckung im Küstengebiet Pommerns und Ostpreußens bis zum baltischen Höhenrücken, desgleichen im schlesischen Berglande oberhalb 200 m, im Elbe-, Saale- und Wesergebiet oberhalb 300 m. Im Gegensatz zu den östlichen Teilen Bayerns, wo in diesen Tagen die Schneefälle ausblieben, gewann im Westen die erst am 19. sich bildende und bis auf 250 m Höhe herabgehende Schneedecke vielfach eine Stärke von 10—12 cm. Schneefälle, die mit der Verlagerung einer Balkandepression nach dem Ostseegebiet zunächst in Süddeutschland eintraten und sich über Norddeutschland ausbreiteten, brachten auf dem östlichen pommerschen Höhenrücken eine vorübergehende Neuschneedecke von 10 cm Höhe und verstärkten die in den mittleren Gebirgslagen neuerdings entstandene Schneebedeckung. Eine aufkommende feuchte Nordwestströmung veranlaßte weitere Schneefälle am 24. und im schwäbischen Teil der Alpen noch am 26.; im Schwarzwald und in den böhmischen Randgebirgen oberhalb 800 m wurden schließlich 20 cm, in den Alpen etwas über 25 cm Schneehöhe festgestellt. Mit der am 27. einsetzenden Erwärmung schwand die Neuschneedecke, bildete sich aber am Monatsschluß infolge Ausbreitung einer Mittelmeerdepression nach Süddeutschland nochmals vorübergehend im Westen auf den Gebirgen des Rheins, wo sie im Rothaargebirge in einer Stärke von 25 cm auftrat.

Im allgemeinen nahm die dauernde Schneedecke der höheren Gebirgslagen im Laufe des April langsam ab; erst oberhalb 1300 m zeigte sie in den Alpen eine stetige Zunahme in ihrer Mächtigkeit bis zum 27., so daß schließlich Nebelhorn 375 cm, Zugspitze 670 cm, Herzogstandhaus 180 cm, Wendelsteinhaus 205 cm, Brünnsteinhaus und Hochgernhaus 100 cm und der Predigtstuhl 199 cm Schneehöhe verzeichneten. Abgesehen von einigen wenigen Alpenlagen in 900 m Höhe, die wie z. B. Linderhof, Valepp, Stuben etwas reichliche Schneeansammlungen im Verlaufe des Winters hatten, blieb die Schneedecke bis zum Monatsschluß im allgemeinen nur in Lagen über 1100 m bestehen; im Schwarzwald vermochte auch auf dem Feldberg die in der letzten Dekade entstandene Neuschneelage das Monatsende zu überdauern.

# Die Schneedecke im Mai 1938.

**Allgemeine Übersicht:** Die in Lagen über 1100 m vorhandenen Schneedecken nahmen im Laufe des Monats Mai fortlaufend ab und verschwanden in der ersten Dekade auf dem Feldberg im Schwarzwald und auf dem Brocken, um den 10. herum bis zu 1300 m, um den 20. etwa bis zu 1500 m hinauf; oberhalb 1800 m war sie über das Monatsende hinaus von Bestand.

Außerdem kam es auf den Höhen noch zu vereinzelten kurzandauernden Neuschneelagen etwa bis zu 700 m herab, so in den Algäuer Alpen am 1. und 2. bei vorherrschenden nördlichen Winden, desgleichen am 20. auf dem Brocken und im Alpengebiet, als auf der Westseite einer von Finnland nach Italien reichenden Tiefdruckfurche Kaltluftmassen zuströmten.

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß eine Schneedecke nicht gelegen hat; Fl., daß einzelne Schneeflecke vorhanden waren; 0, daß eine sehr dünne oder eine stellenweise durchbrochene, aber noch zusammenhängende Schneedecke gelegen hat; ☒, daß eine Schneedecke vorhanden war, deren Höhe nicht gemessen wurde; ein Strich oder ein freies Feld, daß eine Beobachtung nicht stattgefunden hat.

## Die Schneedecke im September 1938.

Eine von der Adria einwandernde Störung brachte am 8. September zunächst auf den Gipfeln des westdeutschen Berglandes bis zum Harz eine nur einen Tag anhaltende, dünne Schneedecke. In den Alpen, wo zu Monatsbeginn auf den Höhen oberhalb 2600 m bereits Schnee lag, ging er bei der vom 16. bis Ende des Monats anhaltenden schönen Nachsommerwitterung rasch zurück, so daß vom 18. an selbst auf der Zugspitze, die in den ersten Septembertagen noch 40 cm Schnee aufweisen konnte, nur noch Schneeflecken verzeichnet wurden.

## Die Schneedecke im Oktober 1938.

Bei Zufuhr feuchter Meeresluft, die mit dem Monatswechsel die spätsommerliche Warmwetterperiode zum Abschluß brachte, erhielten die Alpen am 2. und 3. in Höhen über 1800 m eine dünne, nur für einen Tag bestehende Schneedecke; die mit einer weiteren Meeresluftstaffel am 4. und 5. in Lagen oberhalb 2000 m entstehende Schneedecke wich langsam bis zum 16. auf 2500 m zurück. Die Schauertätigkeit am 19., die mit dem Einbruch kühler Meeresluft im Mittelgebirge vielenorts den ersten Schnee brachte, schuf auf dem Brocken und der Schneekoppe für einen Tag, auf den Alpengipfeln oberhalb 1500 m eine bis zum 23. andauernde Schneedecke; auch auf der Zugspitze, die am 5. etwa 20 cm Schnee hatte, blieben nach Eintritt wolkenloser Witterung nur einzelne Schneeflecken zurück. Mit einer vom Nordatlantik bis zum Mittelmeer reichenden Tiefdruckrinne verursachten am 26. und 27. Schneefälle in Höhen über 1000 m, in Westdeutschland sogar über 700 m eine schwache, nur 1 bis 2 Tage bleibende Schneedecke. Am 30. und 31. rückte die Schneegrenze bis auf 1400 m hinauf.

## Die Schneedecke im November 1938.

Der November war bei seinem außergewöhnlich milden Charakter äußerst schneearm. Die in den Lagen über 1400 m vorhandene Schneedecke, die mit den Niederschlägen des 3. noch einen Zuwachs von 5—7 cm erfahren hatte (Schneekoppe und Fichtelberg hatten dabei nur vorübergehend Neuschnee), ging auf dem Feldberg im Schwarzwald schon am 4. auf geringe Reste, auf der Zugspitze von 15 cm am 9. auf eine durchbrochene Schneedecke zurück. Die Schneefälle am 18. brachten außer den Alpengipfeln noch den Höhen der Sudeten über 1000 m für 1 bis 2 Tage eine dünne Schneeschicht. Am 21. und 22. entstand von West nach Ost fortschreitend, im Westen bis 700 m, in den Sudeten bis 900 m eine schwache Schneelage, die am 23. und 24. sich zwar noch verstärkte, bis 26. aber wieder verschwand. Zum 26. und nochmals zum 30. gab es eine vorübergehende Erneuerung der Schneedecke. Die Schneehöhe überstieg im Laufe des Monats nirgends 15 cm.

## Die Schneedecke im Dezember 1938.

Die Schneegrenze, die bei der zunächst noch anhaltenden milden Witterung nach den Niederschlägen des 2. und 3. wieder auf 1300 m herabging, rückte mit Schneefällen, die mit einer ozeanischen Störungsfront am 4. und 5. auftraten, in Mitteldeutschland bis auf 500 m, im Süden des Reiches bis auf 700 m herunter. Mit den starken Niederschlägen, die bei der anhaltenden kühlen Westwinddrift weiter herrschten, nahmen die Schneelagen an Mächtigkeit und auch an Ausdehnung zu; am 6. und 7. in Norddeutschland vorübergehend schon in Lagen über 150 m waren sie erst oberhalb 200, in den Sudeten oberhalb 400 m bis zum 10. von Bestand. Die milde und teilweise heitere Witterung, die mit dem 7. und 8. aufkam, verlagerte die untere Schneegrenze vom 10. bis 15. in Süddeutschland wieder auf 1000 m, in den deutschen Mittelgebirgen auf 800 m Höhe. Im Laufe des 15. vollzog sich ein kräftiger Witterungsumschwung, indem ein arktisches Hoch, das über Nordosteuropa erschien, mit seinen vorstoßenden Kältewellen zu weit verbreiteten Schneefällen führte. Am 15. entstand schon in Ostpreußen, am 16. in den Sudeten und im Gebiet der mittleren Oder eine Schneelage von zunächst höchstens 3 cm Stärke. Nach dem am 17. auch im Stau der norddeutschen Mittelgebirge sich eine etwas stärkere Schneedecke gebildet hatte, veranlaßte am 18. eine Staffel arktischer Kaltluft unter neuerlichen Schneefällen bis zum 20. ihre Ausbreitung über ganz Deutschland. Weitere Niederschläge, die vom 21. ab mit dem Vorstoß von Mittelmeer-Depressionen nach der Ostsee hin fielen, erhöhten die bisher noch geringe Mächtigkeit der Schneedecke, zunächst in Mitteldeutschland, zum 23. im Alpenvorland, zum 25. und 26. in Ostdeutschland. Bei anhaltender Kaltluftzufuhr aus höheren Breiten verursachte eine am 28. und 29. im Westen des Reiches andringende Meeresluft stärkere Aufgleitniederschläge, so daß der Feldberg im Schwarzwald eine Schneehöhe von 45 cm, die Wasserkuppe eine solche von 25 cm erreichte. Während zum Monatsschluß am Unterrhein unter Wirkung milder Westwinde die Schneedecke verschwand, erfuhr sie sonst, namentlich im Berglande, mit bis zum 31. sich wiederholenden Niederschlägen noch einen weiteren Zuwachs.

Die Schneedecken erreichten im allgemeinen ihre größte Mächtigkeit in den letzten Tagen des Monats; sie belief sich in der norddeutschen Tiefebene auf 5—15 cm, in den mittleren Höhen auf 30—40 cm und ging erst oberhalb 1500 m über 60 cm, oberhalb 1900 m über 100 cm hinaus.

Eine den ganzen Monat anhaltende Schneedecke hatten nur die Alpen in Höhen über 1500 m, nach den Schneefällen am 2. und 3. auch das Alpenvorland oberhalb 600 m. In West-, Mittel- und Ostdeutschland hatten die Gebirge vom 4. ab in Lagen oberhalb 700 m dauernd Schnee; eine Ausnahme bildeten die Osthänge des Schwarzwaldes, die vom 7. bis 19. bis 900 m hinauf schneefrei blieben. Vom 20. und 21. an lag in allen Höhen des ganzen Reichsgebietes Schnee und hielt, abgesehen von Niederungsgebieten an der Westgrenze, wo am 29. und 30. Tauwetter einsetzte, bis über den Monatsschluß hinaus an.

---

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß eine Schneedecke nicht gelegen hat; Fl., daß einzelne Schneeflecke vorhanden waren; 0, daß eine sehr dünne oder eine stellenweise durchbrochene, aber noch zusammenhängende Schneedecke gelegen hat; ⊠, daß eine Schneedecke vorhanden war, deren Höhe nicht gemessen wurde; ein Strich oder ein freies Feld, daß eine Beobachtung nicht stattgefunden hat.
