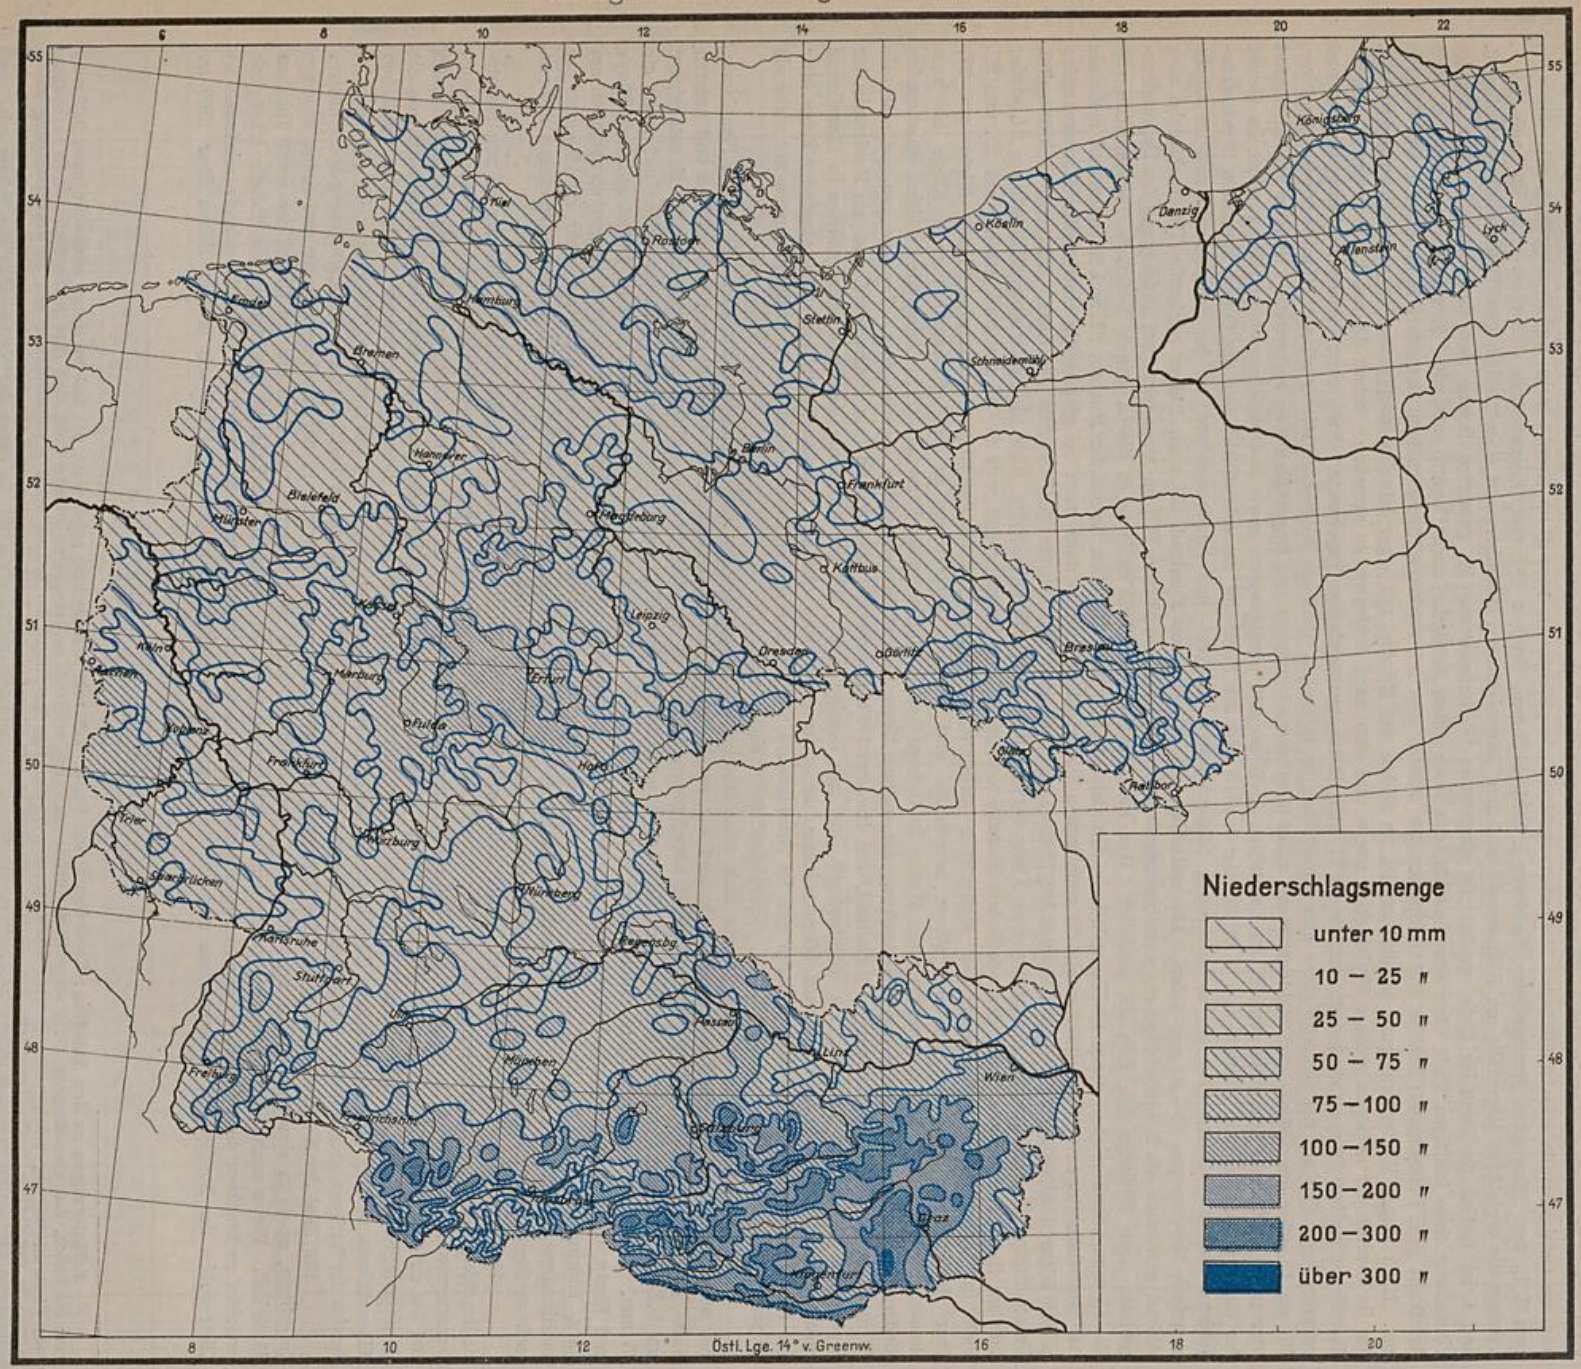
# Die Niederschläge im Mai 1938.

**Allgemeine Übersicht:** Der Mai war für einen größeren Teil des Reiches zu naß.

Da zu Monatsbeginn gegenüber einem südnorwegischen Hoch eine Mittelmeerdepression nach Mitteleuropa eingriff, so herrschte in den ersten Tagen des Monats in Deutschland bei nördlichen Winden trübes und zu Regenfällen neigendes Wetter. Die Regenfälle zeigten mit Tagesmengen von mehr als 25 mm bis zum Morgen des 1. eine besondere Ergiebigkeit am Nordrande des deutschen Berglandes und am Ostalpenrande einschließlich des Niederdonaugebietes, desgleichen bis zum 2. im Mosel-, Main- und Neckargebiet, schließlich bis zum 3. in den böhmischen Randgebieten (Goldberg i. Schl. 51.2 mm, Seichau 49.8 mm, Pilgramshain 40.2 mm). Erst im Laufe des 3. nahmen die ergiebigen Regenfälle am Böhmerwald und dem österreichischen Donaubergland einschließlich des Wienerwaldes, mit dem 3. und 4. im Gebiet der Drau ihr Ende, so daß die eintretende Wetterbesserung im gesamten Reiche sich durchsetzen konnte. Mit der Einstellung eines kräftigen Tiefs über Skandinavien, das noch einen Ausläufer nach Ungarn entsandte, überflutete am 7. und 8. kalte Arktikluft ganz Deutschland; Schnee und Graupelschauer wirkten sich mit stärkeren Niederschlägen besonders in Steiermark und Kärnten aus. Nach kurzer Wetterberuhigung tauchte am 10. im Süden des Reiches mit einer Mittelmeerdepression ein neues Regengebiet auf, das im Bereich der Ostalpen größere Ergiebigkeit zeigte und sich nach Schlesien zu verschob. Schon die am 11. gemessenen Mengen überstiegen vielfach 50 mm, wiederholt auch die am 11. und 12. zusammengefaßten Tageswerte. Nach einer Periode trockener, warmer und heiterer Tage stieß auf der Südseite eines über Großbritannien lagernden Tiefs am 16. feuchte Meeresluft nach Nordwestdeutschland vor, die am 17. über ganz West- und Süddeutschland unter Gewittererscheinungen und Regenfällen sich verbreitete. Mengen von annähernd oder mehr als 50 mm fielen bis zum 18. im Emsgebiet, in Ober- und Niederbayern sowie in Oberösterreich und bis zum 19. im Gebiet der Gail. Der anhaltende Zustrom von Kaltluft, der am 19. auf der Rückseite des schließlich über der Ostsee lagernden Depressionsgebietes einsetzte, führte weiterhin zu reichlichen Niederschlägen in West- und Süddeutschland, wo im Schwarzwald und im Allgäu mehrfach Mengen von 35—40 mm fielen. Als schließlich am 20. eine von Finnland bis nach Italien reichende Tiefdruckfurche sich bildete, gewannen die Niederschläge ein ganz besonderes Ausmaß, zumal sie bis zum 23., im Alpengebiet bei Abdrängung des Depressionsgebietes nach Südosten bis zum 25. anhielten. Das mitteldeutsche Bergland meldete in diesen Tagen mehrfach Tagesmengen von 35—45 mm. Noch reicher waren die Regenfälle in den Ostalpen, wo namentlich im Gebiet der Mur am 21. und 22. insgesamt mehr als 100 mm niedergingen (Hebalm 160.1 mm); die anhaltenden Niederschläge führten dann auch bei gleichzeitig eintretender Schneeschmelze in den höheren Alpenlagen zu einer verheerenden Hochwasserkatastrophe im Talzuge der Mur und der Gurk. Mit einer Kaltluftstaffel, die am Südrande eines vor der südnorwegischen Küste verweilenden Tiefs sich entwickelte, lebte die Niederschlagstätigkeit am 24. wieder auf; am Harz, Thüringerwald und den nördlichen Kalkalpen hinterließ sie Tagesmengen von 30—40 mm und brachte am 25. und 26. noch in Ostpreußen Regenmengen von stellenweis mehr als 50 mm. Einem ostwärts wandernden Hoch folgte am 27. über der Nordsee ein Tief, das mit seiner langsamen und unsteten Verlagerung an der südskandinavischen Küste bis zum Monatsschluß vielfach trübes und regnerisches Wetter im Gefolge hatte. Die in breiter Front am 27. in Südwestdeutschland einsetzenden Niederschläge pflanzten sich mit der Störungsfront, der weitere Meeresluftstaffeln nachfolgten, ostwärts fort. Tagesmengen von mehr als 25 mm wurden am 29. beobachtet im Havelland, am Harz und Thüringerwald, im Vogtland, am Böhmerwald und am Nordrande der Alpen, am 30. in der Prignitz, am Böhmerwald und am Ostalpenrand. Mit der Auflösung des Depressionsgebietes in Einzelkerne entwickelten sich zum 30. und 31. stark böige Schauer, die unter gewittrigen und z. T. starken Regen in raschwechselnder Folge über das Reich hinwegzogen. Mehrfach beliefen sich im Schwarzwald und an den nördlichen Kalkalpen die Einzeltagesmengen auf mehr als 50 mm, die Gesamtmenge für den 29.—31. vielfach auf mehr als 75 mm.

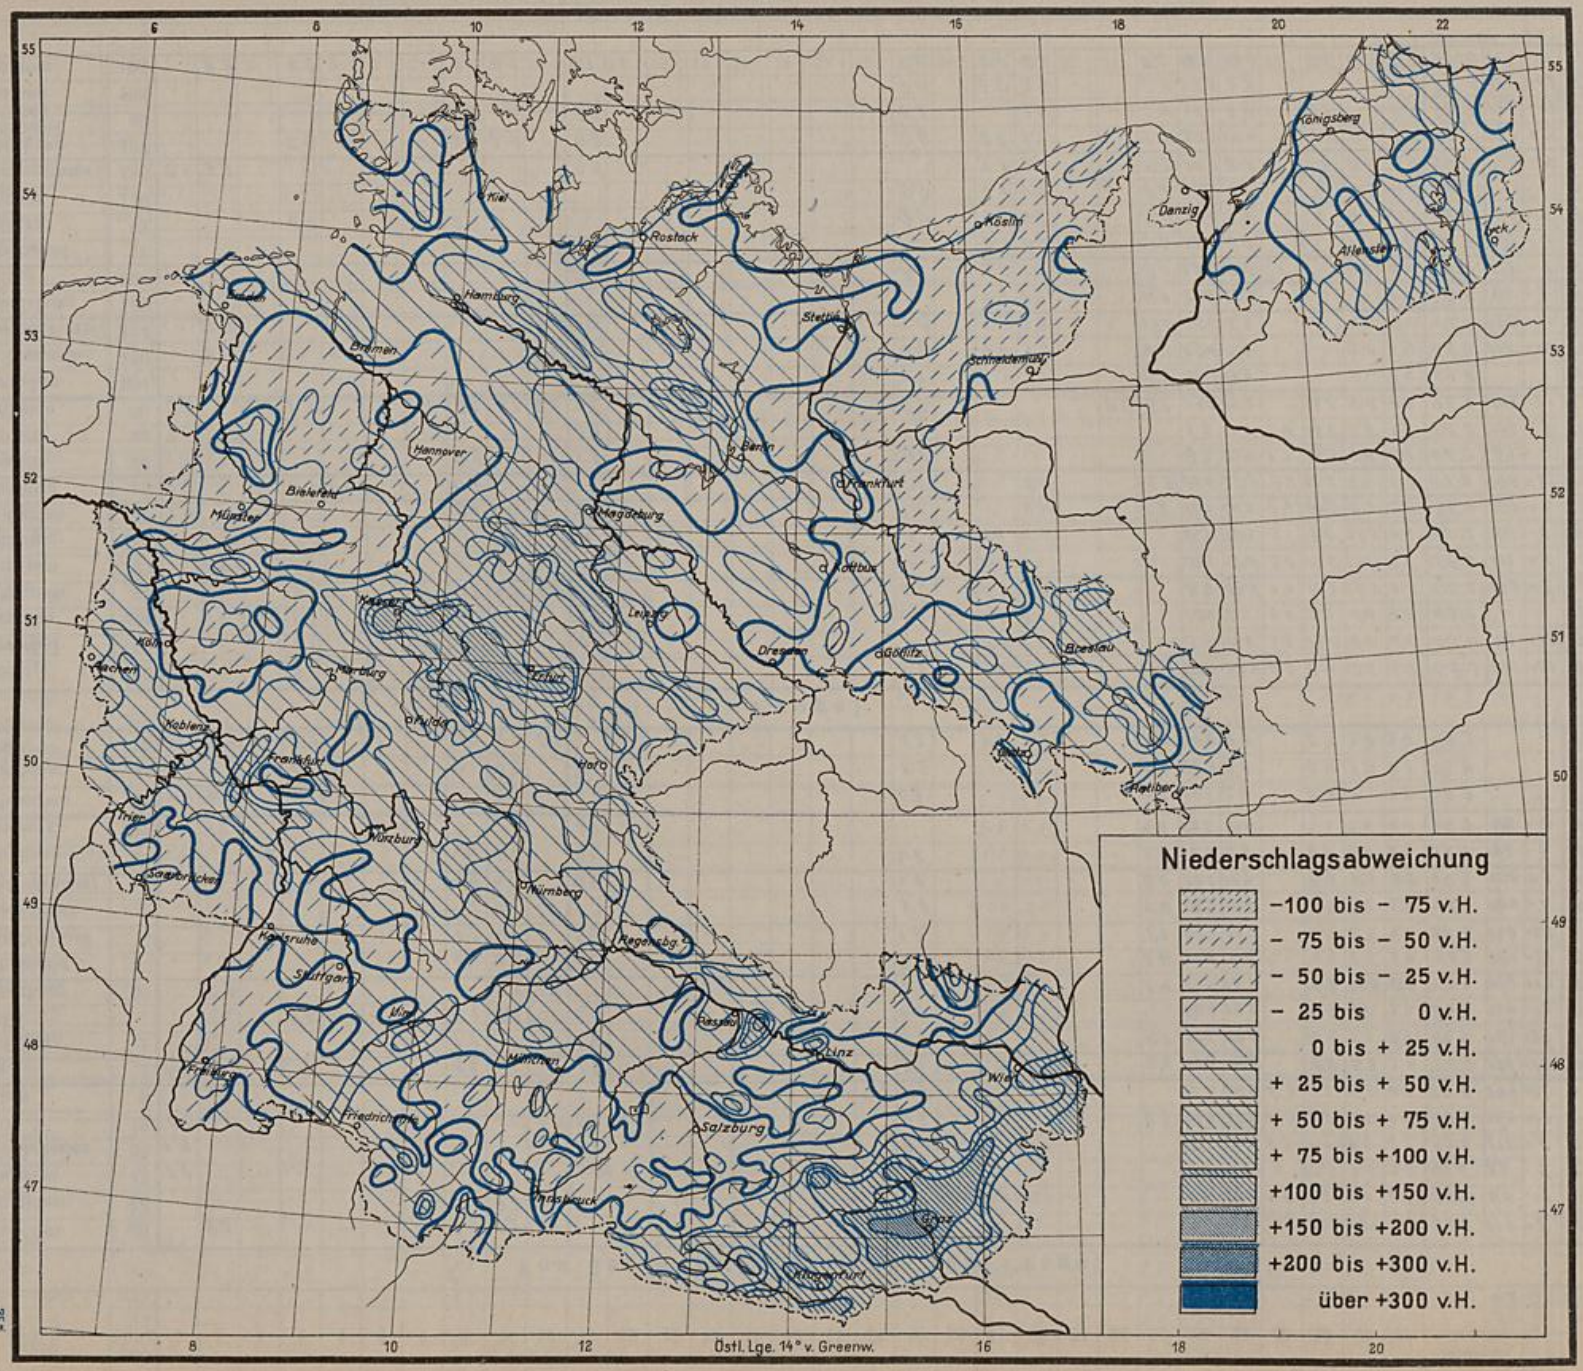
In der Niederschlagsverteilung zeigte sich eine merkliche Abhängigkeit von den Geländeverhältnissen. Selbst im Flachlande, das vom Unterrhein bis zur Lüneburger Heide und bis zur Leine, in Schleswig-Holstein, im Bereich der mittleren Elbe und unteren Havel, sowie in den Landesteilen vom Odergebiet ostwärts weniger als 50 mm Niederschlag aufwies, steigerten sich die Monatsbeträge am holsteinischen-mecklenburgischen und am östlichen masurischen Höhenrücken sowie im Hügelland Mittelschlesiens auf mehr als 75 mm. Im Berglande hatten auch einige wenige Leelagen wie am Haardt, an der Rhön, am Donauried und im Gebiet zwischen Thaya und Kamp unter 50 mm Gesamtniederschlag. An allen Mittelgebirgen aber nahmen die Monatsmengen zu und stiegen vornehmlich am Harz, Thüringerwald, an der Rhön, an den böhmischen Randgebirgen, am Schwarzwald und an den Alpen auf mehr als 100 mm, um im Riesengebirge 150 mm, in Teilen der nördlichen Kalkalpen und vornehmlich im Bereich der Ostalpen bis zu den Karawanken 200 mm noch zu überschreiten. Mehr als 300 mm Niederschlag wurden in der Stub- und Koralpe verzeichnet.



Der langjährige Durchschnittswert wurde nicht erreicht in den bereits genannten Gebieten mit weniger als 50 mm Monatsniederschlag, dazu in Niederschlesien mit der Oberlausitz, sowie am Oberrhein mit teilweisem Einschluß des Saar- und Neckargebietes. Bemerkenswert ist, daß im Bergland zwischen Lahn und Ruhr, im Schwarzwald, schließlich auch an der Nordalpenkette bis zum Engadin und bis zu den Hohen Tauern hinüber die Monatsmenge nicht ganz den Normalbeträgen entsprach. In dem übrigen Gebiet nahmen die Monatsmengen vielfach auf 150% des langjährigen Durchschnittswertes zu, so an den bereits bezeichneten Stellen des baltischen Höhenrückens und im mittelschlesischen Hügelland; im mitteldeutschen Bergland, namentlich am Harz und Thüringerwald, wie auch im Bereich der östlichen und südlichen Alpenländer wurde stellenweise das Doppelte, in Steiermark das 2½fache des Normalbetrages überschritten.

Die Zahl der Niederschlagstage war fast durchweg der Jahreszeit angemessen; nur in der Lüneburger Heide und seiner weiteren Umgebung, sowie in einzelnen Teilen des nördlichen Alpenvorlandes blieb sie zu gering, mehrfach um ein Drittel der sonst üblichen Häufigkeit. Wenn auch nur in den besonders der Erwärmung ausgesetzten Gegenden die Zahl der Gewittertage die übliche Häufigkeit erreichte, so brachten doch $^2/_3$ bis $^3/_4$ der Niederschlagstage Mengen von mehr als 1 mm. Schneefall wurde im Flachlande vereinzelt im Küstengebiet der Nordsee, in Oberschlesien und auf den Berggipfeln beobachtet, in größerer Häufigkeit erst in Höhen über 1500 m.

---



**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊠) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (⊛) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um $7^h$ eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⌣) gibt die Gesamtmenge mehrerer Tage.

Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.

# Die Niederschläge im Juni 1938.

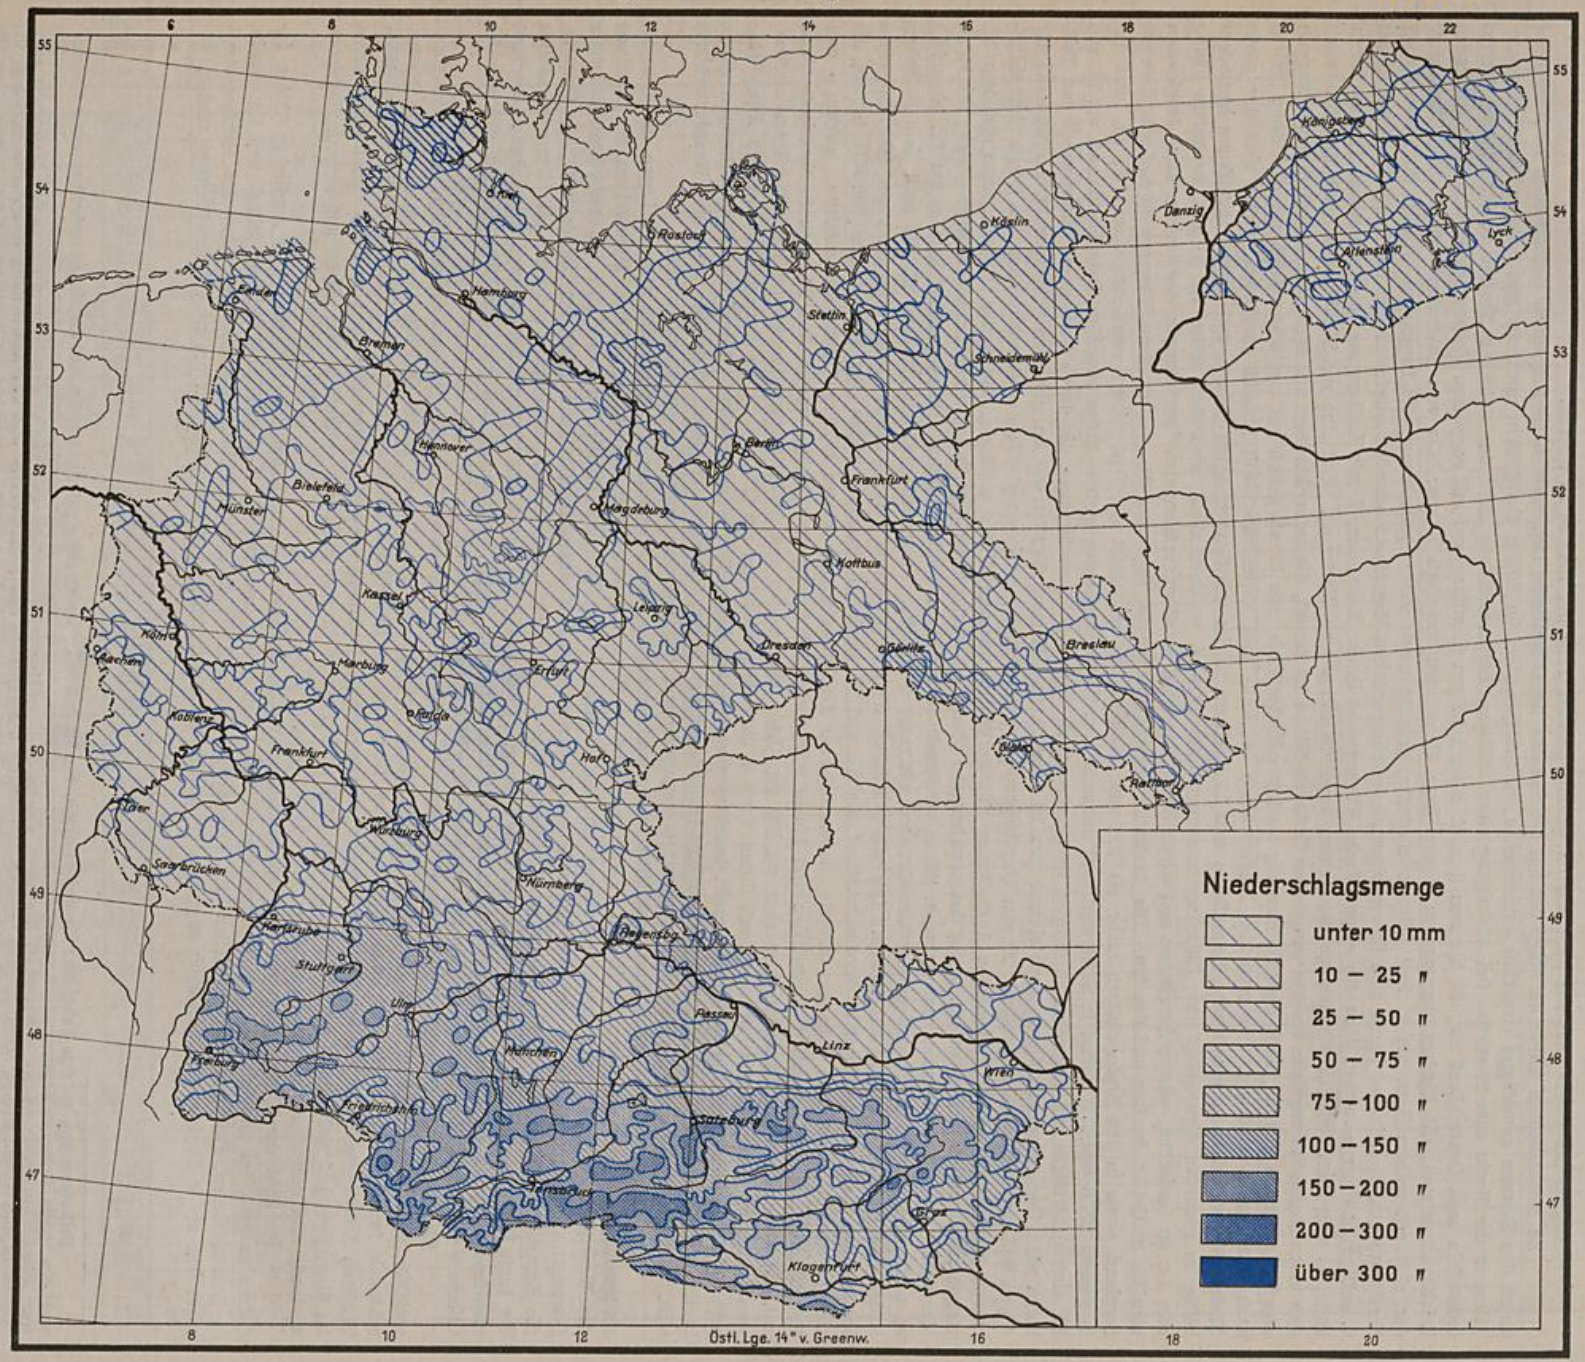
**Allgemeine Übersicht:** Der Juni war im weitaus größten Teile des Reiches zu trocken.

Zu Monatsbeginn wurde die Folge der auf der Südseite nordatlantischer Depressionen vordringenden Regenfronten vorübergehend durch den Zustrom gemäßigter Tropikluft unterbrochen, so daß besonders im Süden des Reiches trockenes und heiteres Wetter einsetzte. Schon in der Nacht zum 2. stießen bei Ausbildung einer kräftigen Tiefdruckstörung über der südlichen Nordsee wieder kühlere Meeresluftstaffeln nach Deutschland vor, die bis zum 3. z. T. unter kräftigen Gewittern und mit ergiebigen Niederschlägen sich über das ganze Reich verbreiteten; die Niederschlagsmengen dieser Tage überstiegen mehrfach 50 mm. Ein vom Azorenhoch ausgehender Ausläufer, der sich mit seinem Kern am 4. über Böhmen einstellte, drängte rasch unter Aufheiterung die Regenzone ostwärts ab. Wenn auch Nordwestdeutschland in der Nacht zum 6. von einer niederschlagsreichen Regenfront betroffen wurde, südlich des Hauptalpenkammes am 6. heftige Gewitter auftraten, dazu das ostpreußische Küstengebiet in der Nacht zum 7. mit Vorübergang einer schwachen Störung Regen hatte, so hielt doch sonst in Mitteleuropa das heitere, trockene und warme Wetter an. Erst eine von Skandinavien nach Mittelfrankreich sich erstreckende Störungslinie brachte zum 9. den Einbruch kühler Meeresluft, die unter Gewittern und ergiebigen Regenfällen erst langsam ostwärts an Raum gewann, nach dem Vorübergang nordeuropäischer Tiefs vom 12. ab jedoch mit verstärkter Kraft aus nördlichen Breiten nach Mitteleuropa eindrang. Während die Niederschläge in Nord- und Mitteldeutschland alsbald nachließen, wirkte sich der große Niederschlagsreichtum in anhaltenden Regenfällen vom 13. bis zum 15. im württembergischen Gebiete und unter Stauwirkung besonders heftig im gesamten Alpengebiet aus; Einzeltagesmessungen am 11.—13. ergaben allein wiederholt mehr als 50 mm, besonders häufig zum 14. im badischen, württembergischen und schwäbischen Bergland, wo es zu verheerenden Überflutungen des Neckars kam, desgleichen zum 15. im Gebiet der Isar und des Inn. Die Gesamtniederschlagsmenge der Tage vom 10.—16. ergab im Schwarzwald und schwäbischen Bergland, sowie in den Alpen vielfach mehr als 100 mm; Naßfeldhütte im Gebiet der Gail (Drau) verzeichnete am 13., 14. und 15. insgesamt 107,6 mm. Während in Süddeutschland nunmehr eine Wetterberuhigung eintrat, liefen über Norddeutschland noch am 16. und 17. einige Störungs- und Regenfronten hinweg, desgleichen nach kurzer Schönwetterpause, die durch Verlagerung eines westlichen Teilhochs nach Ungarn veranlaßt war, noch einmal vom 19. zum 20. eine Meeresluftstaffel, die am südlichen Schwarzwald, am Nordrand der Alpen und am Böhmerwald vereinzelt 20 mm übersteigende Tagesniederschlagsmengen absetzte. Die Ausbreitung des Hochs über Mitteleuropa brachte erst vom 21. allgemeine Aufheiterung mit trockenem, warmem Wetter zustande, das in der Ostmark schon seit dem 17. vorgeherrscht hatte. Schon am 23. geriet das norddeutsche Flachland wieder unter den Einfluß nordatlantischer Depressionen; die kühle Meeresluft, die von der Nordsee her einbrach, führte vereinzelt zu stärkeren Niederschlägen. Demgegenüber kam es am 22. besonders an und in den Alpen zu föhnartigen Gewitterstörungen mit recht erheblichen Niederschlägen, die sich am 23. bis nach dem südlichen Baden und bis nach Franken verbreiteten. Der mit westlichen Winden erfolgende Vorstoß subtropischer Meeresluft am Südrande eines schottischen Tiefs rief zunächst in Norddeutschland, am 25. und 26. auch im gesamten Süden des Reiches eine Schwüle hervor, die sich in starken gewittrigen Schauern äußerte, namentlich als die Westwinddrift wieder kühlere Luftmassen zuführte. Störungs- und Regenfronten, die bei lebhaften Westwinden von einem schottischen Tief ausgingen, traten am 27. und 28. noch in Norddeutschland auf. Während diese Erscheinungen hier aber vor der von Osten kommenden und Aufheiterung bringenden Warmluft weichen mußten, veranlaßten die kühlen Meeresluftmassen mit ihrem Vorstoß über Süddeutschland am 28. und 29. im Bereich der östlichen Alpen eine rege Gewitterentwicklung, die stellenweise recht beachtenswerte Niederschläge über 50 mm zeitigte. Diese gewittrigen Störungsvorgänge breiteten sich nun zum Monatsende über das westliche Deutschland aus, indem die warme Tropikluft gegenüber einer über Westdeutschland sich bildenden Tiefdruckfurche sich wieder nordwärts verlagerte und teilweise zum Aufgleiten gezwungen wurde.

Im Monatsergebnis hatten Nord- und Mitteldeutschland, sowie die vom Ostalpenrande ausgehenden niederen Lagen eine Gesamtniederschlagsmenge von weniger als 75 mm. Strichweise sind im Rheinland und Hessen-Nassau, im östlichen Münsterland, im Flachland des Weser-Leinegebietes, am Ostrand des Harzes und im südlichen Teile der Mark Brandenburg, wie auch im niederösterreichischen Donaugebiet weniger als 25 mm gefallen. Über 75 mm Niederschlag hatten einige Bezirke im Bereich der Nordseeküste, die Prignitz, die Kernsdorfer Höhen und die Züllichauer und Grünberger Hügel. Allgemein nahmen die Monatsbeträge auf mehr als 75 mm zu südlich der Linie Karlsruhe-Regensburg und südlich der Linie Braunau-Wienerwald; sie stiegen im württembergischen und schwäbischen Bergland mehrfach auf mehr als 150 mm, im Alpengebiet noch auf über 200 mm. Es ist bezeichnend, daß von den Mittelgebirgen sich nur der Oberharz mit etwas über 75 mm, das Riesengebirge und der Böhmerwald mit mehr als 100 mm abheben.

Die für den Junimonat übliche Niederschlagsmenge wurde nur in wenigen größeren Landesteilen überschritten, so an der Nordseeküste, auf der mecklenburgischen Seenplatte mit Teilen der Prignitz und der Altmark, in der Osthälfte der Neumark und in Niederschlesien, ferner am Oberrhein und im württembergischen Berglande mit Einschluß Nordschwabens und schließlich in Kärnten. In diesen Gebieten überstiegen die Monatsbeträge den langjährigen Durchschnitt mehrfach um 50%, stellenweise auch um 75%. Zu trocken waren im überwiegenden Maße Nord- und Mitteldeutschland bis nach Franken hinein, sowie der größte Teil der Alpen mit seinem nördlichen Vorlande und dem gesamten Ostalpenlande.

Die Zahl der Niederschlagstage war mit annähernd 20 im Nordseegebiet und mit 16 im Bereich des westlichen Teiles der Ostsee zu groß; im Binnenlande blieb sie durchweg mit 12—14 zu gering und war mit 7—9 auffallend klein am Mittel- und Unterrhein, in Hessen-Nassau, Thüringen und in Teilen des Freistaat Sachsen. Auch die Gewitterentwicklung, die im Süden des Reiches etwas reger war als in Norddeutschland, blieb allgemein gegenüber der sonst üblichen Gewitterhäufigkeit um rund 3 Gewittertage zurück.



---

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊠) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (⊹) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um $7^h$ eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⌣) gibt die Gesamtmenge mehrerer Tage.

Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.

# Die Niederschläge im Juli 1938.

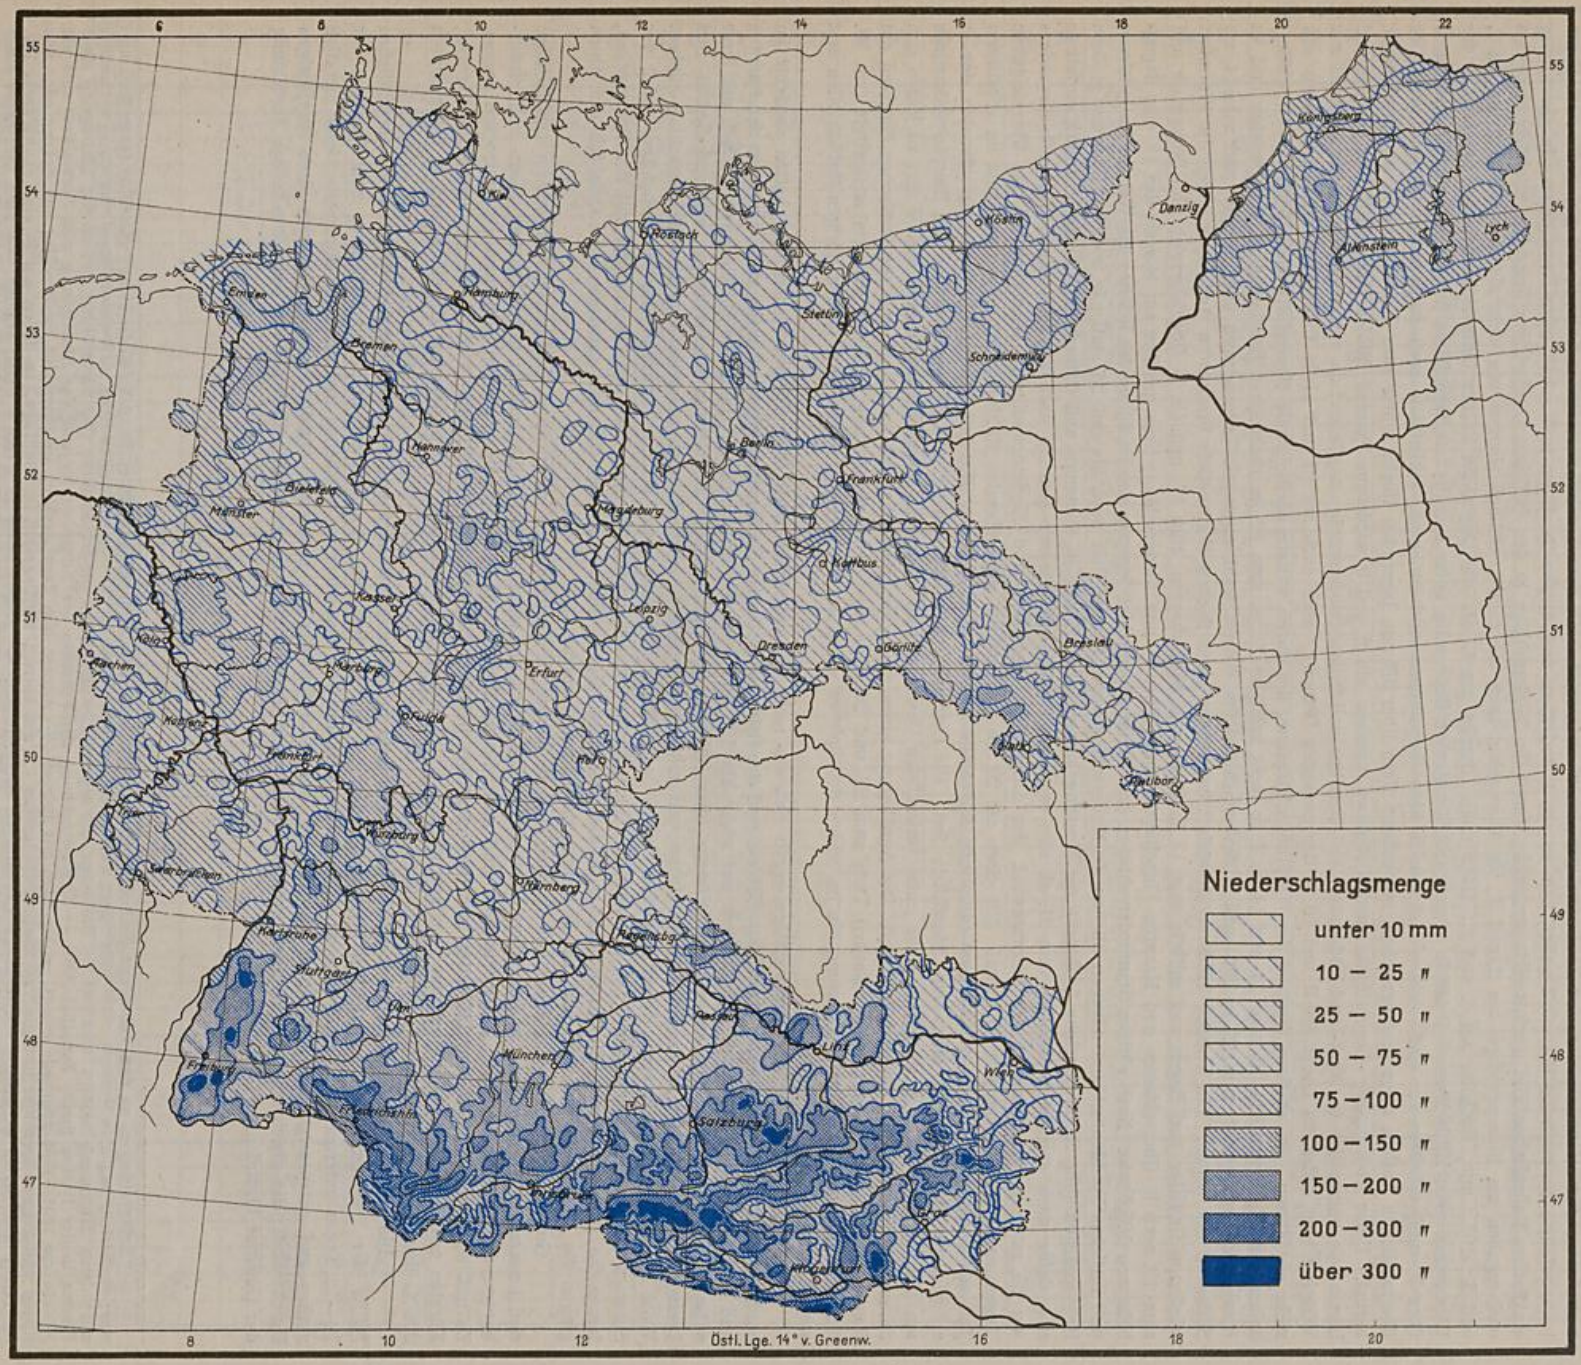
**Allgemeine Übersicht:** Der Monat war namentlich für den Südwesten und Nordosten des Reiches zu naß, in den dazwischen liegenden Gebieten überwiegend zu trocken.

Mitteleuropa, das zu Monatsbeginn zwischen einem azorischen und osteuropäischen Hoch lag, war damit stark den Eingriffen regenbringender Störungsfronten der Nordmeerdepressionen ausgesetzt. Mit dem Vorstoß ozeanischer Kaltluft, die gegen die vom Osten herangeführte suptropische Warmluft anlief, kam es am 1. und 2. zu verbreiteten Gewittern und anhaltenden Regenfällen; da gleichzeitig ein flaches italienisches Tief nordostwärts wanderte, waren die Niederschläge in den östlichen Landesteilen besonders reichlich bemessen und ergaben am Riesengebirge am 2. und 3., im Alpengebiet noch bis zum 4. vielfach Mengen von mehr als 50 mm (Türkheim am 2. und 3.: 103,2 mm, Hochobir am 3. und 4.: 109,6 mm). Bereits am 4., als die Regenfälle in der Ostmark nachließen, brachen an der Westgrenze neue kühle Meeresluftstaffeln einer großbritannischen Depression unter energischen Regenfällen (im Schwarzwald Tagesmengen über 50 mm) ostwärts vor und wirkten sich am 5. über Ostpommern und Schlesien, schließlich auch noch in der Ostmark aus. Der überraschende Aufbau eines umfangreichen, mit seinem Kern über Böhmen lagernden Hochs führte zum 7. Aufheiterung und Erwärmung herbei. Unter Abdrängung dieses Hochs nach Osteuropa brachen am 8. und 9. wiederum Fronten kühler Meeresluft über Deutschland herein, die namentlich in West- und Süddeutschland Gewitter und Schauerniederschläge auslösten; da wiederum ein flaches Adriatief zur Wirkung kam, fielen im Laufe des 9. und 10. in der gesamten Ostmark, aber auch am 10. und 11. in Ostpreußen vielfach Mengen von mehr als 50 mm. Bei starkem Wechsel des Witterungscharakters, der durch weitere nachfolgende Meeresluftstaffeln bedingt war, wiederholten sich die Regenfälle bis zum 13. und 14. z. T. in recht kräftiger Form, zum 12. im rheinischen Berglande, an den Sudeten und im litauischen Grenzgebiet, zum 13. in Süd- und Mitteldeutschland (im Schwarzwald vereinzelt Tagesmengen über 50 mm) und zum 14. am Südrande der Alpen. Ein Vorstoß kühlerer Meeresluft im Gefolge eines flachen Nordseetiefs brachte im Andringen gegen die Warmluft wiederum Gewitter und Regen und zeitigte zum 17. in Ober- und Niederbayern, zum 17. und 18. in Oberösterreich und Steiermark und zum 18. noch in Oberschlesien und Masuren Einzeltagesmengen über 50 mm Niederschlag; Graz meldete am Morgen des 18. eine Regenhöhe von 105,0 mm. Nach einigen Stauniederschlägen des 18. im Alpengebiet besserte sich im Süden des Reiches das Wetter; im mittleren und östlichen Norddeutschland dagegen blieben die Niederschlagszonen flacher Tiefs noch bis zum 23. stationär, sodaß stellenweise größere Regenmengen (am 22. Bredereiche 53,5 mm) zur Messung kamen, am 23. noch in Pommern und Ostpreußen. In der Ostmark entfaltete sich dafür nach starker Erwärmung vom 21. ab eine rege Gewittertätigkeit, die mit dem 23. nach Süddeutschland übergriff; besonders am 25. morgens verzeichneten der Schwarzwald, das Alpengebiet, der Ober- und Niederdonaubezirk wiederholt 50 mm übersteigende Tagesmengen (Hochleckenhaus 90,3 mm). Mit einer am 26. im Kanalgebiet auftauchenden Kaltluftstaffel gingen zunächst im nördlichen Teil der Westgrenze und an der Nordsee energische Regenfälle nieder (am 27. Adenau 67,0 mm, Elsfleth 59,0 mm); sie pflanzten sich in schwächerer Form zum 27. längs der Ostseeküste fort. Die Ostmark hatte dabei am 27. und 28. sowie südlich des Hauptalpenkammes am 29. und 30. wieder in stärkerem Maße unter verbreiteten Gewittern und ergiebigen Regenfällen von mehr als 50 mm zu leiden (am 28. meldete Pustritz im Lavanttal 74,2 mm). Die Annäherung eines azorischen Hochs brachte im mittel- und norddeutschen Bergland am Rande der hier noch vorhandenen flachen Tiefs zum 28. und 29. eine rege Gewitterentfaltung, die sich ostwärts ausbreitete (am 30. Kudowa 51,8 mm); die Wetterbesserung, die im Süden des Reiches schon am 30. wirksam wurde, kam in den übrigen Gebietsteilen erst am 31. zur Geltung.

In der Verteilung der Niederschläge ergab sich ein recht wechselreiches Bild; über 75 mm Niederschlag hatten zunächst im norddeutschen Flachlande die nordwestlichen Gebiete und der Osten, wo teilweise die Monatsbeträge auf mehr als 100 mm, an den Sudeten und am ostpreußisch-baltischen Höhenrücken auf mehr als 150 mm stiegen. Im Berglande traten die Mittelgebirge vielfach mit ihrer näheren Umgebung mit Monatsmengen von teilweise über 100 mm, im Oberharz mehr als 150 mm stärker hervor, während die Tal- und Leelagen ebenso wie der größte Teil des westlichen und mittleren Flachlandes vielfach noch unter 50 mm Gesamtniederschlag blieben. Wohl infolge der etwas regeren Gewittertätigkeit zeigte der Süden des Reiches eine stärkere Zunahme der Monatsbeträge, sodaß der Schwarzwald und der Bayerische Wald, wie auch die Alpen Mengen von mehr als 200 mm, Teile der Zentralalpen und der Karawanken, ferner das Dachsteingebirge, die Koralpe und z. T. die Steirischen Alpen solche von über 300 mm aufwiesen. Im Ostabfall der Alpen gingen die Niederschlagsbeträge rasch auf 75, sogar auf 50 mm herunter.

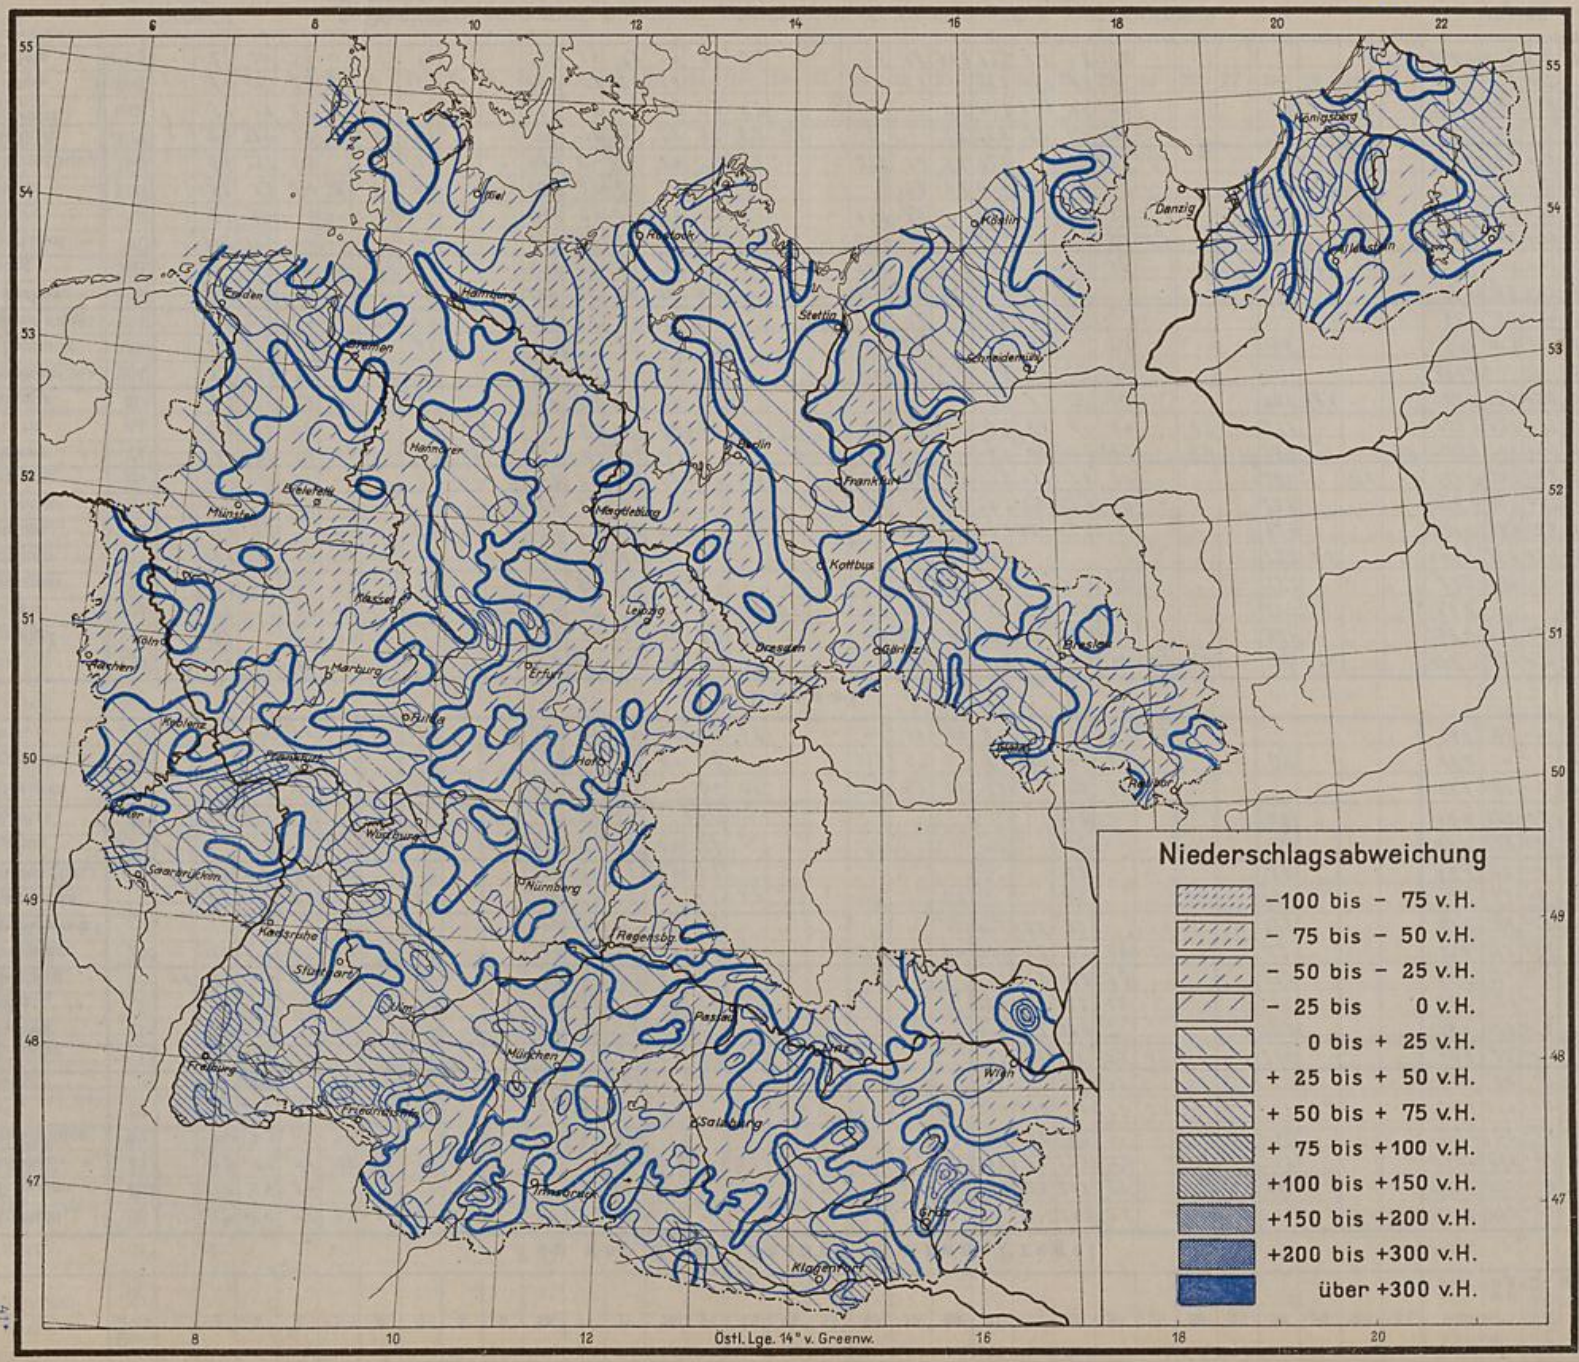
Gegenüber den für den Monat Juli üblichen Mengen blieben die Niederschläge im mittleren Norddeutschland, wie im westfälischen und hessischen Weserbergland und in Oberschlesien verschiedentlich um mehr als die Hälfte zurück; selbst Franken, Ober- und Niederbayern, der Niederdonaubezirk, Untersteiermark und auch die nördliche Hälfte der Alpenkette stellten sich noch als zu trocken heraus. Zu naß waren vornehmlich der Südwesten und Nordosten des Reiches, das Küstenland der Nordsee, das oberösterreichische Waldgebiet, Kärnten mit dem steirischen Alpenzuge; vielfach wurden 150%, am Schwarzwald und im schwäbischen Hügelland und in Unterkärnten 200% überschritten.

Die Niederschlagshäufigkeit war mit 18—20 Regentagen in den nordwestlichen und südwestlichen Gebieten sowie in der südlichen Hälfte der Ostmark etwas zu reichlich bemessen und nahm nur in der Mark Brandenburg, in Teilen Schlesiens und Frankens mit 10—12 Tagen unternormale Verhältnisse an. Die Gewittertätigkeit war besonders im westlichen und mittleren Norddeutschland merklich gering und entsprach selbst im Süden des Reiches, wo 6—9 Gewittertage beobachtet wurden, noch keineswegs dem langjährigen Durchschnitt; die gleichwohl recht häufiger gemeldeten schweren Hagelschläge vermochten allerdings auf eine besonders heftige Ausbildung der Gewitter hinzudeuten.



---

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊠) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (✳) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um $7^h$ eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⌣) gibt die Gesamtmenge mehrerer Tage.



Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.
