# Die Niederschläge im März 1938.

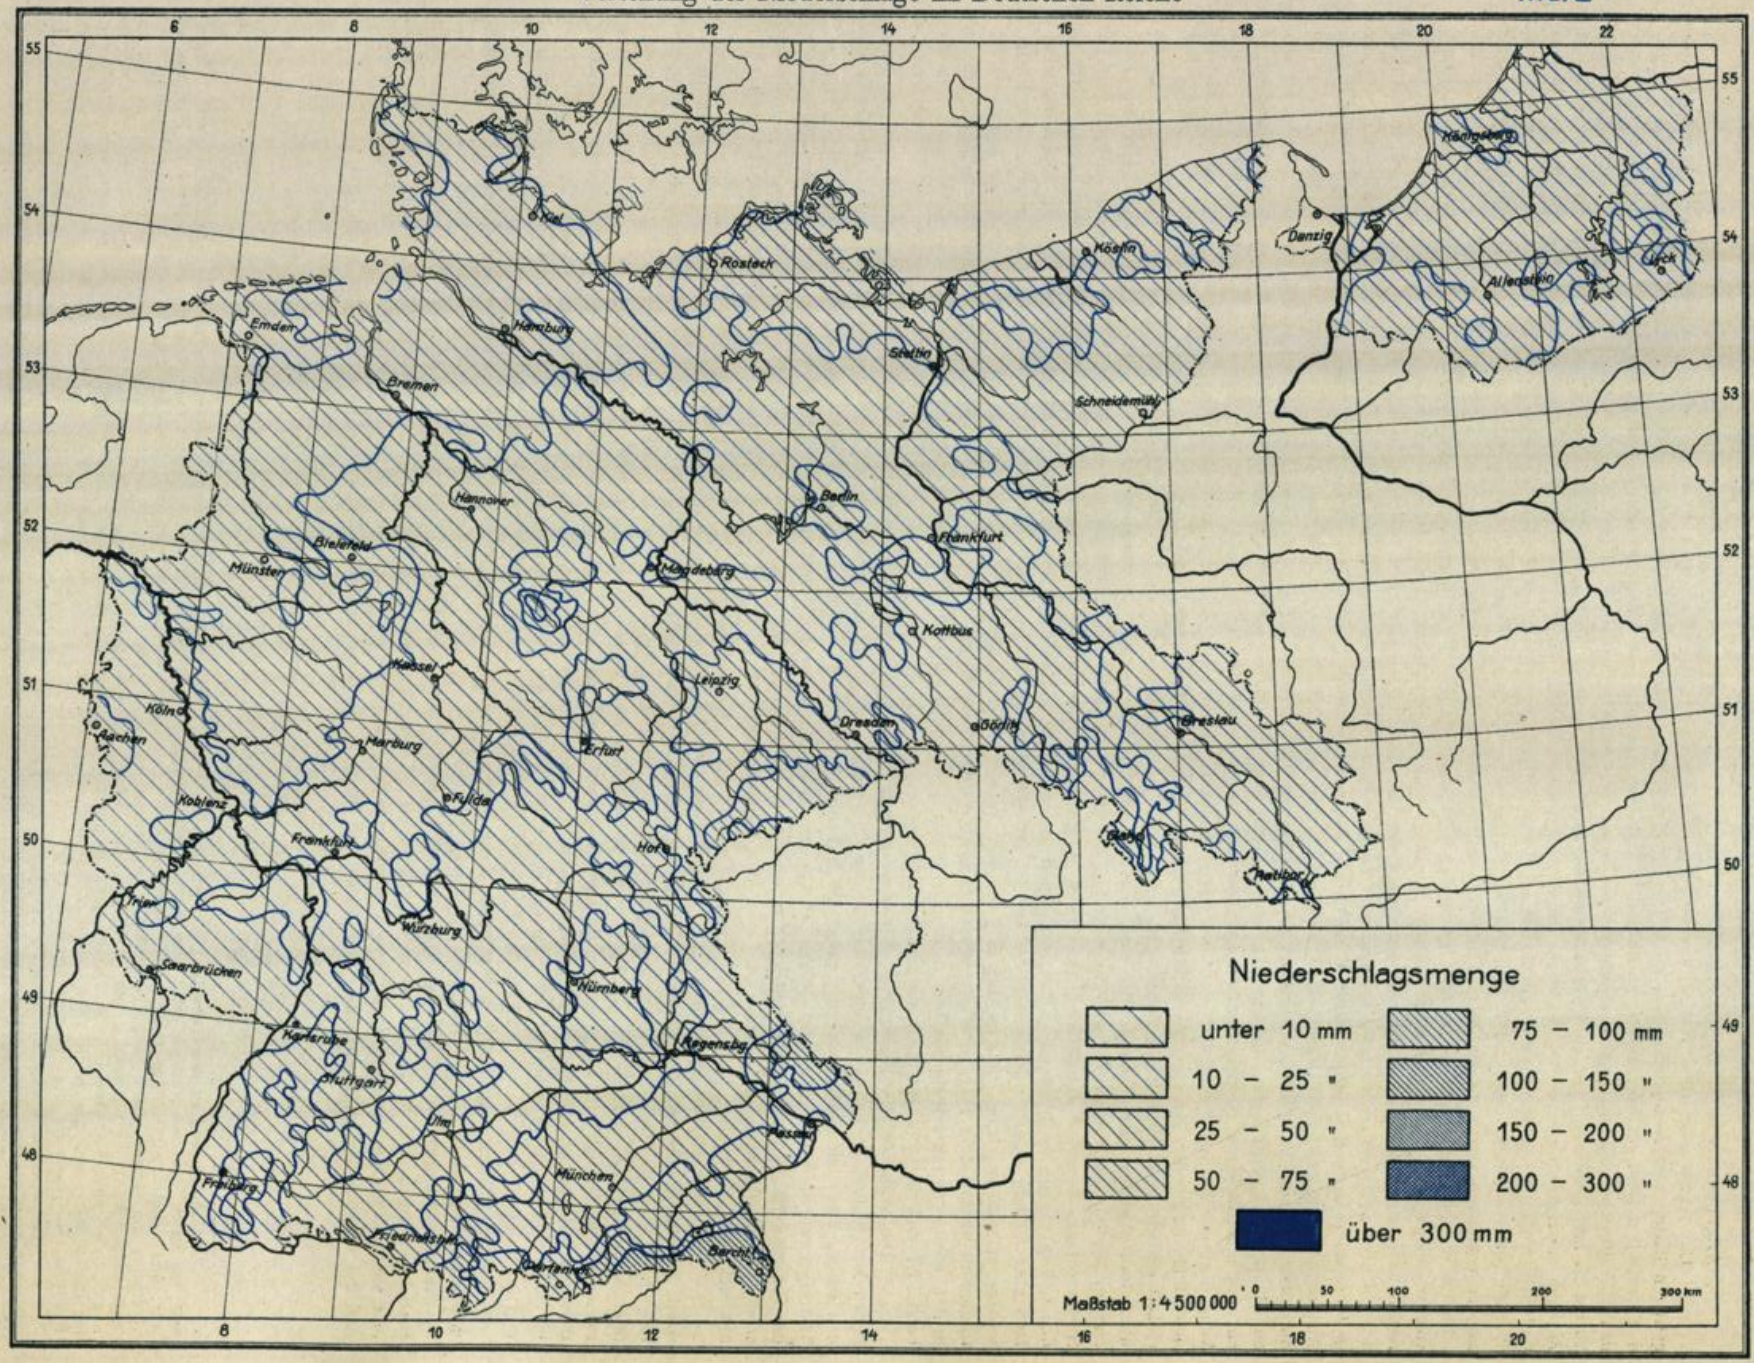
**Allgemeine Übersicht:** Der März war mit Ausnahme einiger östlicher Landesteile zu trocken.

Das regnerische trübe Wetter, das seit dem 26. des Vormonats die Westwinddrift mit ihren Niederschlagsfronten ostwärts vorgetragen hatte, kam zu Monatsbeginn auch über Süddeutschland stärker zur Geltung und brachte mit seinen milden Luftmassen die in den deutschen Gebirgen vorhandenen Schneelagen zum Abschmelzen. Die Niederschläge zu Monatsbeginn fielen an dem östlichen pommersch-baltischen Höhenrücken etwas reichlicher, besonders reichlich aber im Stau der Alpen, sodaß hier wiederholt Tagesmengen von 20 bis 25 mm gemessen wurden (Wendelsteinhaus hatte am 2. und 3. insgesamt 59.5 mm Niederschlag). Im teilweise recht lebhaften Zustrom arktischer Luft auf der Rückseite der Störungsfronten folgten im Wechsel mit zeitweise kräftiger Aufklarung am 2. häufige Regen- und Schneeschauer; selbst als sich am 3. ein atlantisches Hoch dem Kontinent näherte, liefen noch einige zum Aufsteigen gezwungene Warmluftfronten mit Niederschlägen über Deutschland hinweg, die im östlichen Teil der bayerischen Alpen und an den Sudeten vereinzelt Tagesmengen von mehr als 20 mm hinterließen (Grunwald 54.9 mm). Die Niederschläge setzten bald ganz aus, als vom 3. ab die lebhafte Weströmung von einem über Frankreich sich einstellenden Hochdruckgebiet genährt wurde. Die Schönwetterperiode wurde vorübergehend am 7. bei der mit zeitweiligen Nordwestwinden verbundenen Zufuhr frischer Kaltluft durch stärkere Trübung und Sprühregen namentlich am Rande der deutschen Mittelgebirgsschwelle unterbrochen. Stärker wirkte sich am 9. bis 11. ein über Mittelschweden ostwärts wandernder Tiefdruckausläufer aus, dessen Rückseitenströmung aus Nordwest und Nord in ganz Deutschland Trübung und besonders an den Gebirgen stärkere Regenfälle (im östlichen Teil der Alpen mehrfach Tagesmengen über 20 mm) hervorrief. Die Ausbreitung des westlichen Hochs über Mitteleuropa gab vom 12., im Osten erst vom 14. ab die Grundlage zum Bestand eines fast durchweg bis zum 25. währenden trockenen, recht warmen und heiteren Witterungscharakters. Leichte vorübergehende Störungen traten am 16. bei Verlagerung eines flachen schottischen Tiefs nach der Ostsee mit Trübung und Sprühregen an den deutschen Mittelgebirgen ein und hinterließen in Norddeutschland noch bis zum 19. die Neigung zur häufigen Nebelbildung, sowie zur anhaltend stärkerer Bewölkung über der Nordsee. Nachdem sich das Hoch langsam nach den Alpen und zum Balkangebiet verschoben hatte, bildeten sich bei neuerdings steigender Tendenz des Luftdruckes in Mitteleuropa örtliche Störungen, die am 22. und 23. namentlich im Berglande vereinzelt geringfügige Niederschläge auslösten. Erst vom 25. ab setzte mit einem Witterungsumschwung eine Regenperiode ein, als ein über Nordschweden auftauchendes Tief nach Finnland sich verlagerte und mit einer breiten Kaltluftfront, der weitere arktische Luftmassen folgten, stärkere Regen- und Schneefälle, die schließlich in Schauer übergingen, sich über ganz Deutschland ausbreitete. Die Niederschläge, die schon zum Morgen des 26. in Westdeutschland vereinzelt Tagesmengen von 15 bis 20 mm gebracht hatten, waren an den Gebirgshängen recht ergiebig; die am 27. und 28. insgesamt gemessenen Mengen gingen am Schwarzwald und an den Alpen mehrfach über 50 mm hinaus, desgleichen die am 28. und 29. festgestellten Mengen im östlichen Teile der bayerischen Alpen. Die Niederschläge setzten sich zum Monatsschluß in Form von Aufgleitniederschlägen fort, als mit dem 29. von einem Biskayahoch aus Warmluftfronten in unablässiger Folge ostwärts vordrangen. Die Tagesmengen, die an den Erhebungen vielfach über 15 mm hinausgingen, nahmen in den böhmischen Randgebirgen und in dem östlichen Teil der Alpen mehrfach auf 30 mm und darüber zu (am 31. allein in Grattenbach 51.7 mm, in Groß-Iser 58.5 mm).

Die Monatsbeträge schwankten in der westlichen Hälfte des Reiches unter Einschluß von Franken, Brandenburg und dem westlichen Mecklenburg mehr oder weniger um 25 mm; sie nahmen z. T. an den Mittelgebirgen auf mehr als 50 mm zu, um andererseits in den ausgesprochenen Leelagen an der Eifel, am Hunsrück und pfälzischen Bergland, am Taunus, an der schwäbischen Alb, ebenso am Thüringerwald und am Harz unter 10 mm herunterzugehen. Etwas größer, vielfach mit mehr als 50 mm waren die Monatsmengen in der östlichen Hälfte Pommerns und in Ostpreußen, desgleichen in den östlichen Teilen Ober- und Niederbayerns. Die größten Beträge erreichten der Oberharz, der Böhmerwald und die Allgäuer Alpen mit mehr als 75 mm, ferner die östliche Hälfte der bayerischen Alpen mit mehr als 100 mm.

Im Vergleich zum langjährigen Durchschnitt war damit in West- und Mitteldeutschland größtenteils noch nicht die Hälfte der sonst üblichen Menge gefallen, sogar noch nicht ein Viertel in Teilen der Eifel, des pfälzischen und hessischen Berglandes, im Thüringer Hügelland längs der Unstrut, in der Magdeburger Börde, in Ostfriesland, ebenso im Bauland, an den Haßbergen und im Hegau. Schwach übernormale Beträge zeigten sich zunächst in vereinzelten kleineren Gebieten in der Umgebung von Hamburg, an den fränkischen Höhen zwischen der Altmühl und der Pegnitz, am Dachauer Moos sowie im sächsischen und schlesischen Berglande; in größerer Verbreitung traten sie erst im östlichen Ober- und Niederbayern, in Pommern und Ostpreußen in Erscheinung. Hier steigerten sich die Prozentbeträge bis auf 150% des Durchschnittes am östlichen pommerschen und am ostpreußischen-baltischen Höhenrücken, desgleichen im Ermeland und im Samland, dessen nördliche Steilküste ebenso wie die Seesker Höhen teilweise 175% der Normalmenge noch überschritten.

Die Niederschlagshäufigkeit war meist recht gering; sie entsprach mit etwa 15 Niederschlagstagen in Ostpreußen, in den böhmischen Randgebirgen und in den Alpen noch einigermaßen der normalen Häufigkeit und sank nach Westen zu derart rasch ab, daß im gesamten Rheingebiet vielfach nur 6 bis 9 solcher Tage gezählt wurden. Schneefall, der im nordwestlichen Flachlande nur vereinzelt beobachtet wurde, trat in Ostpreußen an 6 bis 8 Tagen ein, eine Häufigkeit, die in den Gebirgen etwa oberhalb 600 bis 700 m, am Rhein erst oberhalb 1000 m erreicht wurde; zur Ausbildung einer vorübergehenden Schneedecke kam es nur an wenigen Stationen des Ostens und der oberbayerischen Hochebene, während sie mit längerer Ausdauer schon stark auf höhere Gebirgslagen beschränkt blieb.



---

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊠) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (⊹) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um $7^h$ eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⌣) gibt die Gesamtmenge mehrerer Tage.

Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.

Monats- und Jahressummen in Prozenten der Normalwerte . . . . . 939

Tagesmengen von 50 mm und mehr; Stark- und Dauerregen:

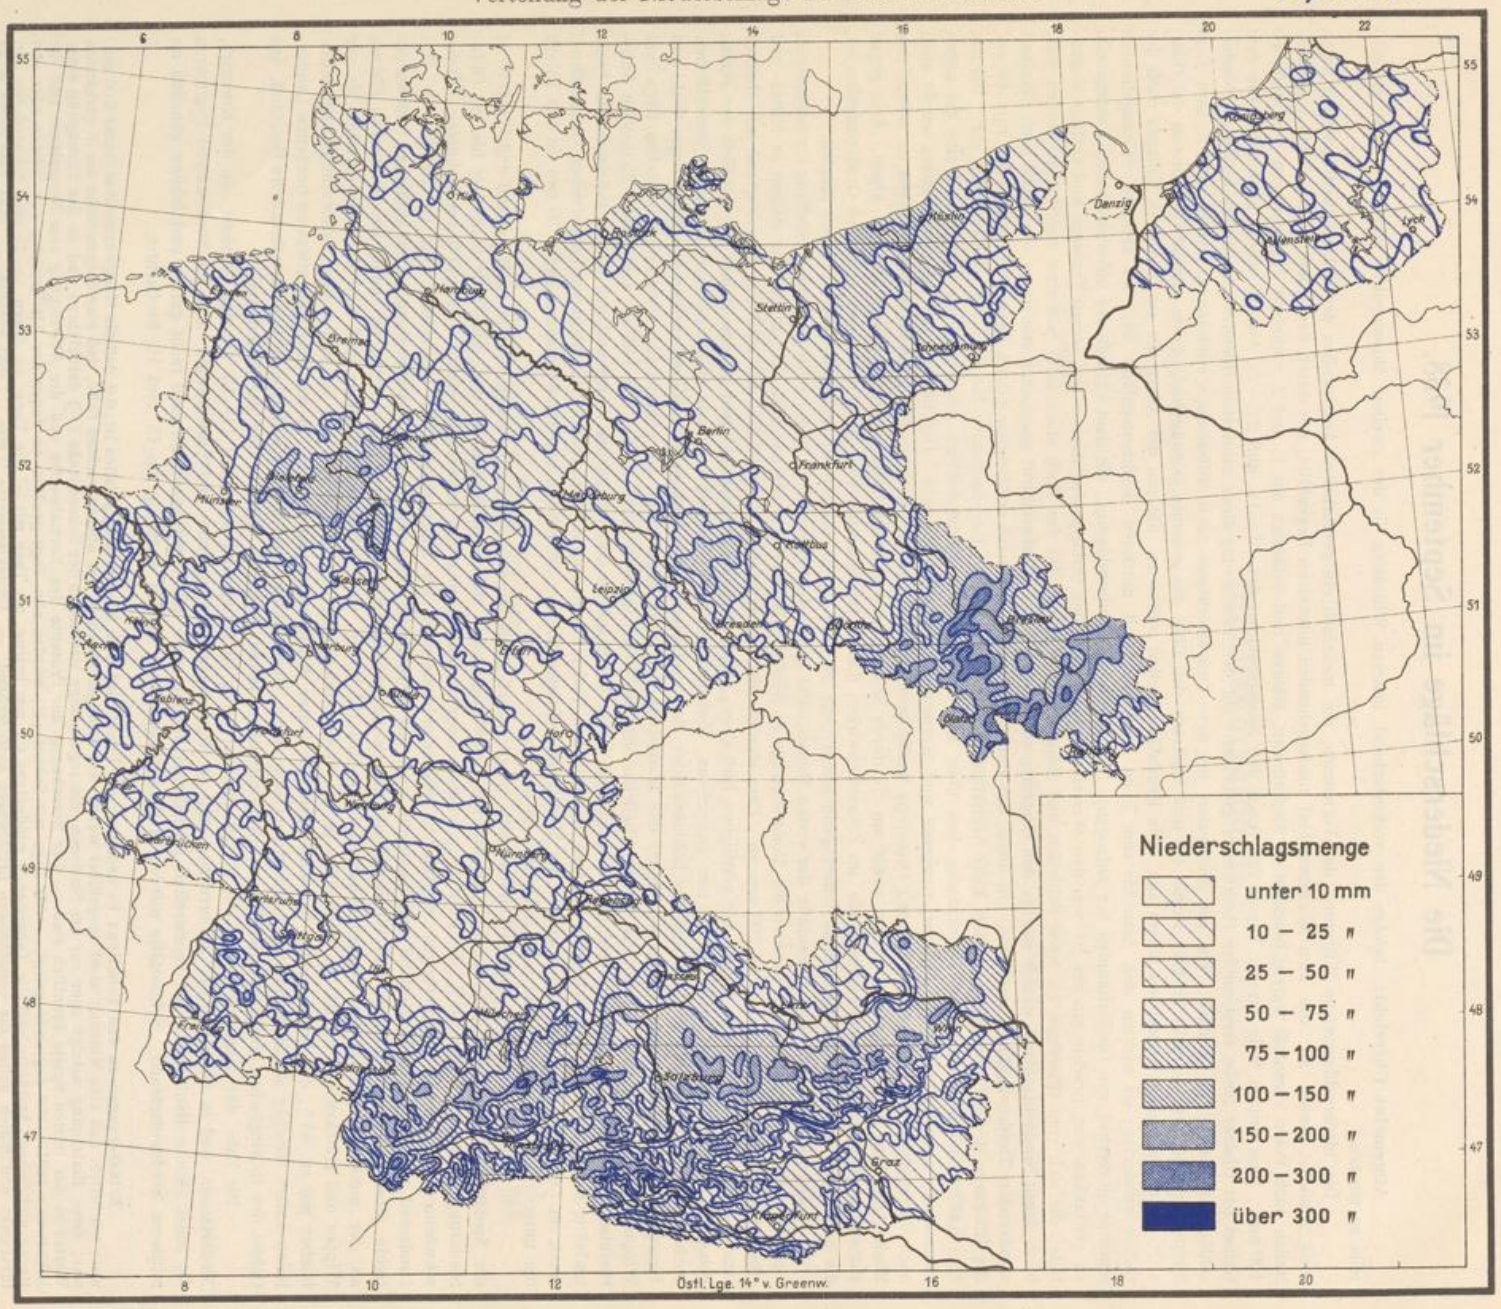
Tagesmengen von 50 mm und mehr . . . . . 946
Stark- und Dauerregen . . . . . 951

# Die Niederschläge im September 1938.

**Allgemeine Übersicht:** Infolge der vorherrschend heiteren Witterung in der zweiten Monatshälfte war der Monat größtenteils zu trocken.

Die niederschlagsreiche Witterung des Vormonats, die mehrfach ein gefährliches Anschwellen der Gebirgsflüsse gezeitigt hatte, hielt zunächst weiter an; die zum Monatswechsel niedergehenden intensiven Regenfälle, die durch den Vorstoß eines Tiefs von Oberitalien nach Polen veranlaßt waren, brachten in Niederdonau, Mähren und Schlesien am 1. und 2. mehrfach Tagesmengen von mehr als 100 mm. Zum dritten Male binnen kurzer Zeit (nach den Niederschlägen des 13.—15. und 22.—27. August) wurde namentlich aus dem Gebiet der Glatzer Neiße zerstörendes Hochwasser gemeldet. Mit der Annäherung eines azorischen Hochdruckausläufers ließen die Niederschläge im Laufe des 2. nach. Da von Südwesten her neue Druckstörungen nach Mitteleuropa eindrangen, setzten vom 3. zum 4. in Süddeutschland erneut recht kräftige Regen ein und breiteten sich über das gesamte Donaugebiet, sowie nordostwärts bis an die Oder, z. T. weiter bis nach Ostpreußen hinein aus. Die Regenfälle hielten weiter an, als von der Adria her am 5. und 6. Teiltiefs nach der Ostsee wanderten; sie wirkten sich dazu bis zum 7. im westlichen und mittleren Norddeutschland aus, wo mehrere Störungsfronten feuchter Meeresluft von Großbritannien her aufzogen. Nach kurzer Wetterberuhigung, die dem Einfluß des näherrückenden Azorenhochs zu verdanken war, brachte ein am 10. von den Westalpen nach Polen sich verlagerndes flaches Tief erneut Trübung und kräftige Regenfälle, die sich vom Oberrhein bis nach Schlesien und Mähren ausbreiteten. Da das Hoch stark nach Südosten abgedrängt worden war, blieb damit Norddeutschland wieder stärker den Eingriffen einer regnerischen Westwinddrift ausgesetzt, die einem von Island nach Finnland wandernden Tiefdruckgebiete angehörte. In diese, das ganze Reich nach und nach erfüllenden milden Meeresluftmassen stieß zum 15. auf der Rückseite des nordeuropäischen Tiefs kalte Arktikluft unter z. T. ergiebigen Regenschauern bis über die Alpen hinweg vor. Der mit dem Kaltlufteinbruch verbundene Druckanstieg ließ über Mitteleuropa einen Hochdruckkern entstehen, der unvermittelt eine bis gegen Monatsende anhaltende Periode heiterer, trockener und warmer Witterung herbeiführte. Der Bestand des schönen Wetters wurde auch nach Verlagerung des Hochs am 18. nach Osteuropa wenig beeinträchtigt, am 19. und 20. durch Bewölkung und Regen im Gebiet des Rheins, der Ems und der unteren Weser, sowie am 25. durch Schauer und einzelne Gewitter im westlichen Teil der Alpen. Erst gegen Monatsschluß brach die Schönwetterperiode im Zusammenwirken flacher Depressionen über dem Mittelmeer und über Großbritannien ab, die nach dem mittleren Norddeutschland vordringend schon vom 29. zum 30. im Westen zu kräftigen Niederschlägen führten.

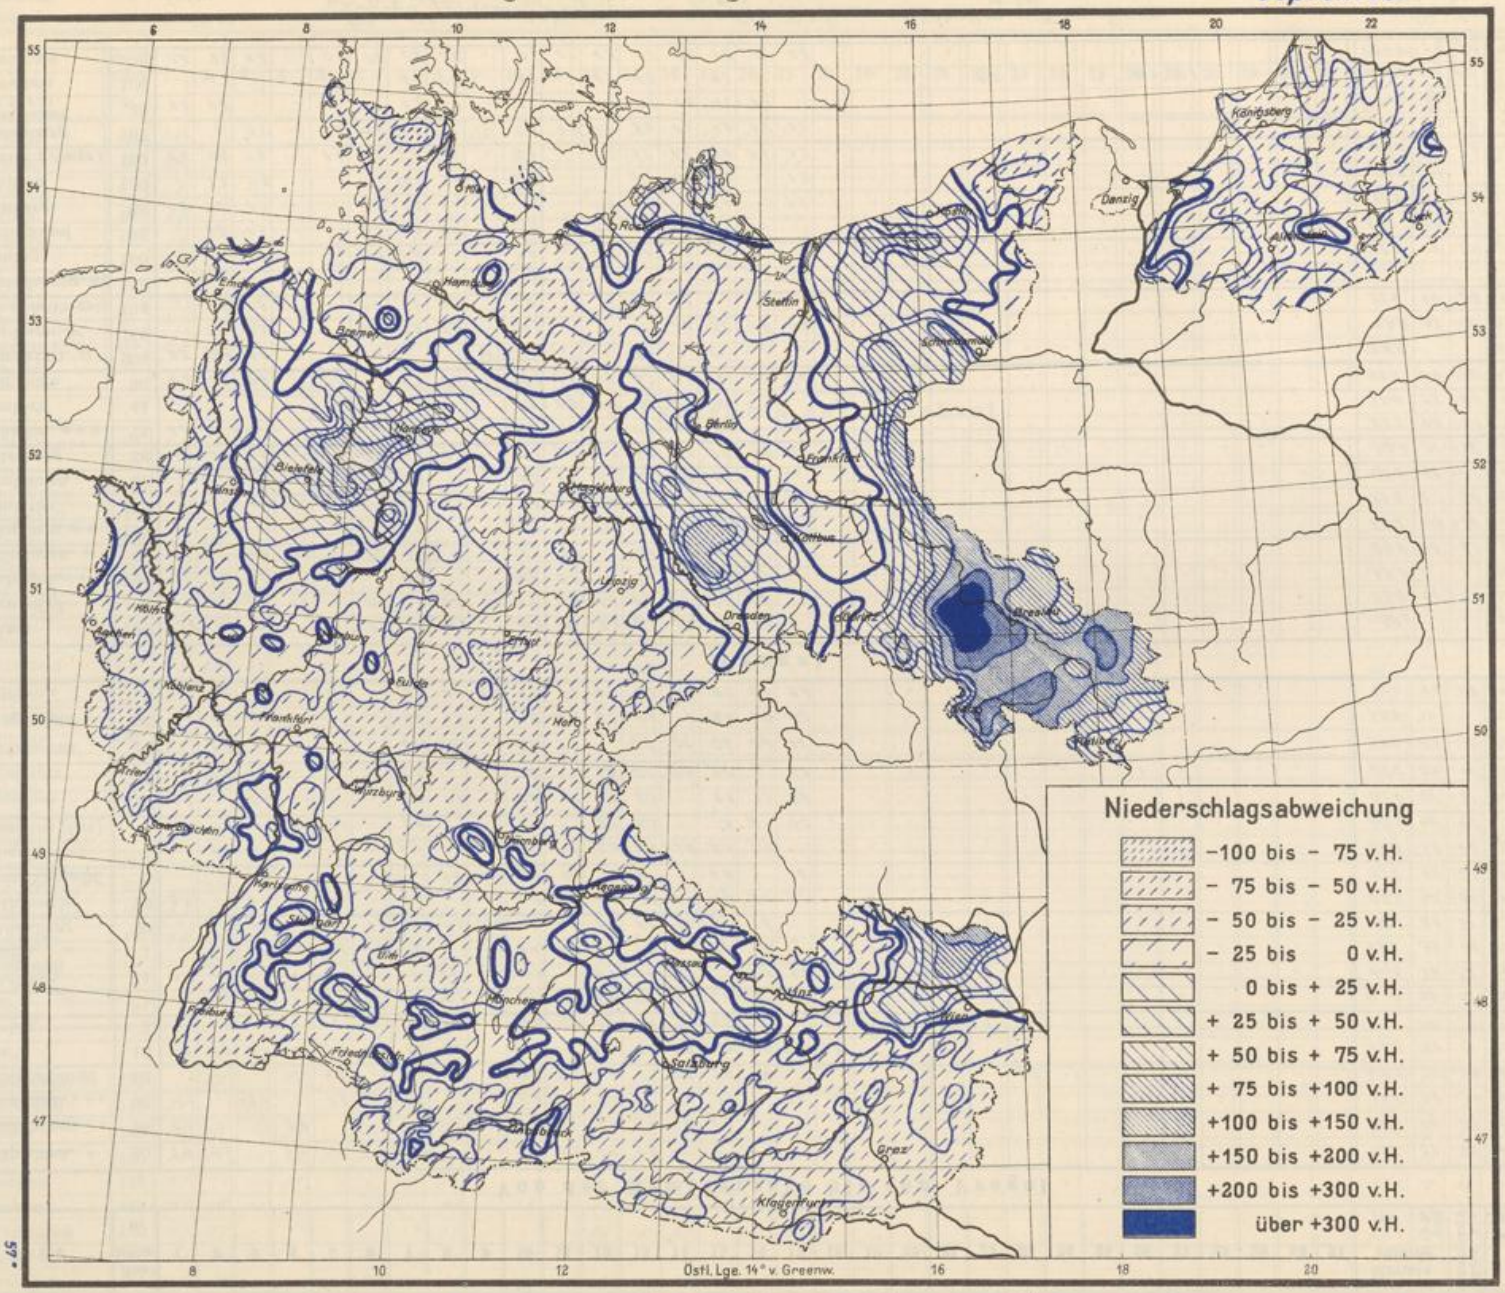
Die wenigen intensiven Regenfälle der ersten Monatshälfte gaben dem allgemeinen Bild der Niederschlagsverteilung ihr besonderes, vielfach zufälliges Gepräge. So nahmen die Monatsbeträge in Niederschlesien rasch auf mehr als 75 mm zu und stiegen in Mittel- und Oberschlesien teilweise auf mehr als 200 mm an. Eine ähnlich niederschlagsreiche Zone bildete das nördliche Alpenvorland mit Mengen von 75—150 mm, die an den Höhen der nördlichen Kalkalpen, selbst noch am Wienerwald und an den Höhen des nördlich der Donau gelegenen Waldviertels auf mehr als 150 mm anwuchsen. Zwischen 100—150 mm schwankende Monatsbeträge wiesen im wesentlichen noch auf: Teile des Schwarzwaldes und des Böhmerwaldes, das westfälische und hannoversche Weserbergland mit Teutoburger Wald und Eggegebirge, das Gebiet der Schwarzen Elster, der Nordostteil der Insel Rügen und die pommersche Ostseeküste zwischen Rega und Wipper. Im größten Teile des übrigen Reiches beliefen sich die Monatsmengen unter 50 mm und blieben noch unter 25 mm im linksrheinischen Bergland, in Mitteldeutschland, das etwa mit Teilen Nordfrankens die Gebiete der Werra und der ganzen thüringischen Saale umfaßte, ferner im nördlichen Schleswig-Holstein, in westlichen Teilen Mecklenburgs, dazu mehrfach in kleineren Landstrichen Ostpreußens. Auch im Leeschutz der Zentralalpen gingen die Monatsbeträge namentlich in Steiermark und im Burgenland unter 50 mm, in den Tälern der unteren Mur und der Lafnitz noch unter 25 mm herunter.



In Prozenten des langjährigen Durchschnitts umgerechnet steigerten sich die übernormalen Beträge im Hügelland und Waldviertel der Niederdonau bis auf 250 % in der Nikolsburger Umgebung, noch stärker in Schlesien, wo große Teile nordwärts bis zur Obra-Niederung auslaufend über 250 %, die sonst leegeschützte Gegend von Liegnitz und Schweidnitz etwas über 400 % verzeichneten. Etwas schwächere übernormale Steigerungen zeigten die Niederschlagsmengen im Alpenvorland des Inngebietes (bis zu 200 %), in dem Landesteil vom östlichen Münsterland und Sauerland über das westfälische und hannoversche Weserbergland bis zur südlichen Lüneburger Heide (über 200 % am Wiehen- und Wesergebirge), im Gebiet zwischen Elbe und Spree (über 200 % im Gebiet der Schwarzen Elster), an der mecklenburgischen und vorpommerschen Küste (bis 175 %), in dem Gebiet vom Stettiner Haff und der Ihna ostwärts bis zur Wipper und Küddow (bis zu 200 %), schließlich in der Weichselniederung (bis zu 150 %). Die an sich hohen Niederschläge der Alpen blieben mit rd. 65 % der Normalmenge bezeichnenderweise hinter den Erwartungen zurück. In den sonstigen etwas zu trockenen Landesteilen hatten weniger als 50 % mehrere Landstriche Ostpreußens, Mecklenburgs und Schleswig-Holsteins, das linksrheinische Bergland, das Gebiet der thüringischen Saale und der Werra mit Nordfranken, ferner Teile von Kärnten und der Steiermark.

Die Zahl der Regentage war mit 7—10 fast durchweg zu gering und nahm auf 11—13 an der Nordsee, in der Kurmark, Niederlausitz und in Schlesien zu; sie erreichte mit 15 Regentagen im Sauerland und Schwarzwald und im Nordostzipfel Pommerns die sonst übliche Häufigkeit. Mit vereinzelten Ausnahmen blieben auch die Gewittertage an Zahl recht gering und fehlten gänzlich im mittleren Norddeutschland. Schneefälle wurden in Gebirgslagen über 1000 m erstmalig am 15. und 16. beobachtet.

---



**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊗) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (⊹) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um $7^h$ eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⌣) gibt die Gesamtmenge mehrerer Tage.

Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.

# Die Niederschläge im Oktober 1938.

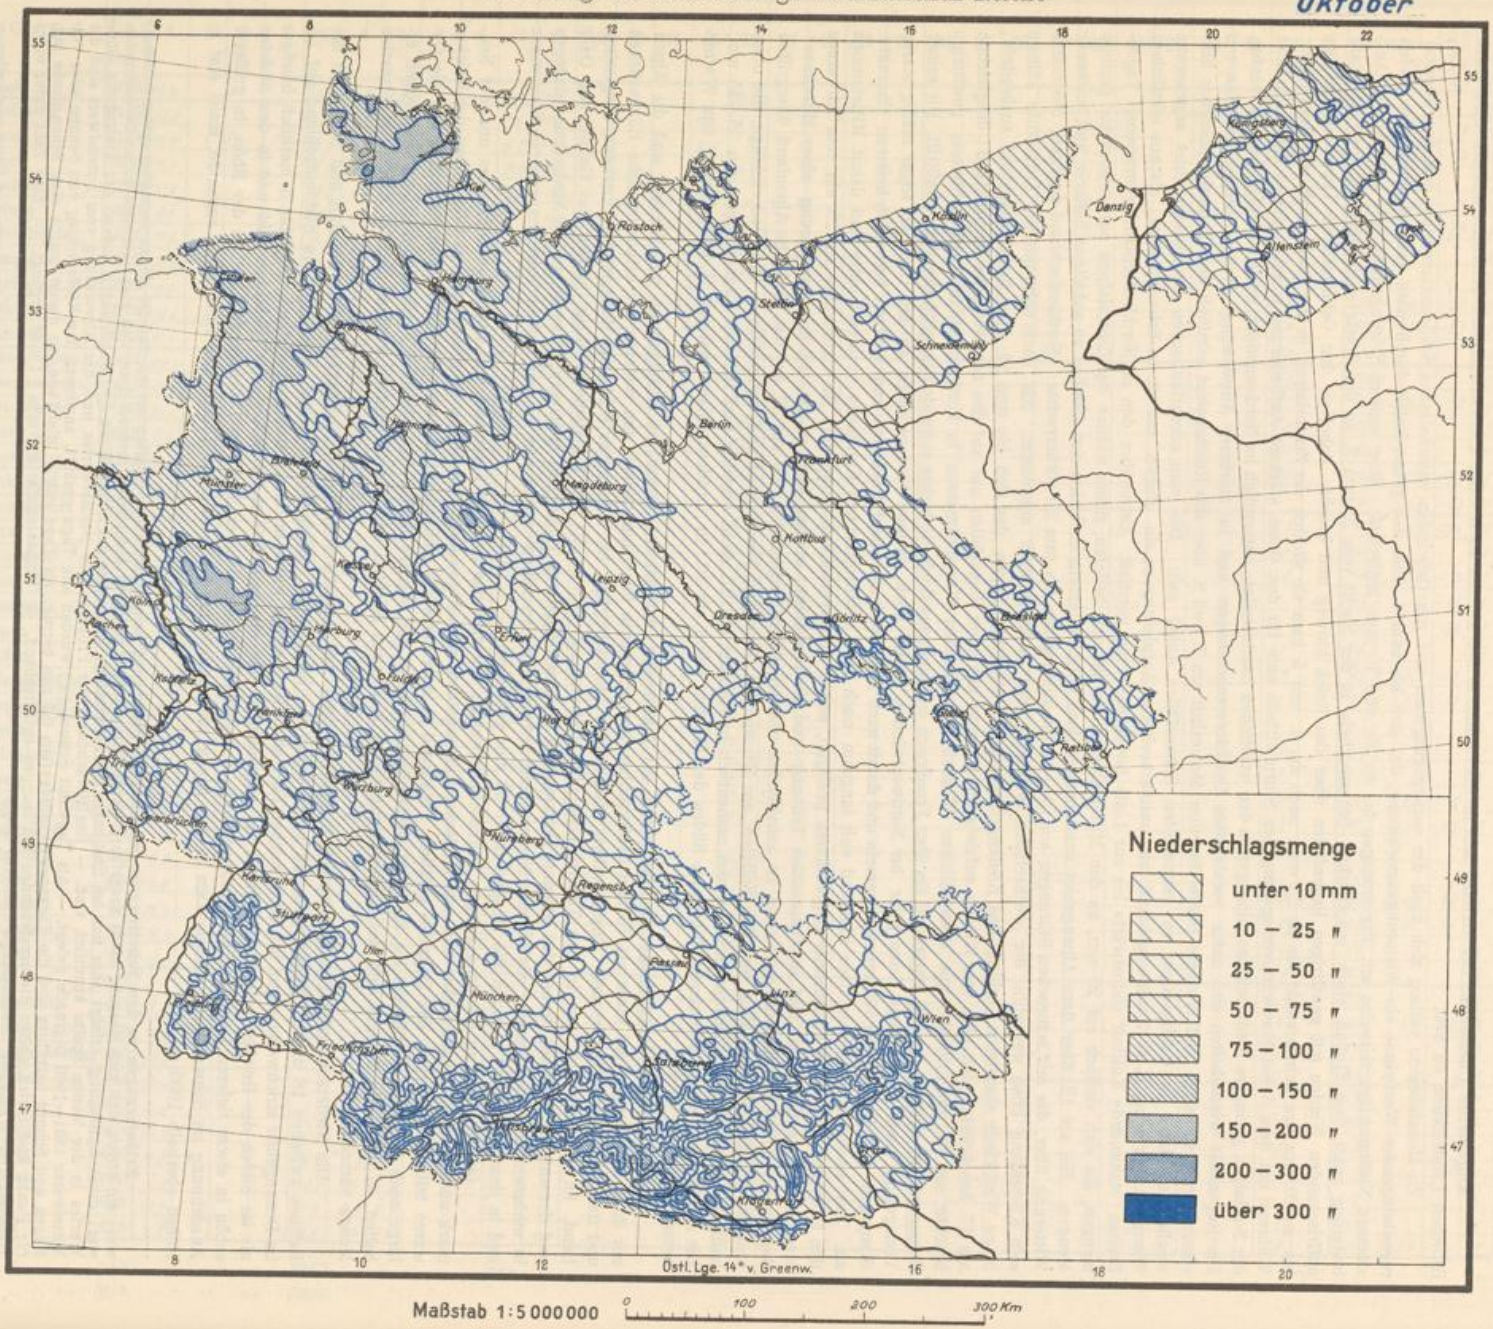
**Allgemeine Übersicht:** Der Oktober war in der Südhälfte des Reiches zu trocken und vornehmlich in nordwestlichen und nordöstlichen Landesteilen zu naß.

Zu Monatsbeginn vollzog sich nach der vorangegangenen und von Ostwinden unterhaltenen Schönwetterperiode mit dem Vorstoß regenbringender Westwinde ein Witterungsumschwung, der sich bis zum 3. über das ganze Reich durchsetzte und namentlich im Süden stärkere Niederschläge teilweise mit Tagesmengen bis zu 30 und 40 mm hinterließ. Eine weitere Störungsfront, die nach kurzer Aufheiterung unter dem Einfluß eines schottischen Sturmwirbels in der Nacht vom 2. zum 3. an der Westgrenze erschien, ging bei stark auffrischenden Winden mit gewittrigen Regenfällen über das Reich hinweg und brachte dabei an den Gebirgszügen Tagesniederschläge bis zu 20 mm, am Schwarzwald bis zu 25 mm; noch am 4. und 5. kam sie südlich der Zentralalpen in der Steiermark zur Auswirkung. Während mit dem 5. bei Nordwärtsverlagerung des Sturmwirbels eine für den Osten stärkere Aufheiterung eintrat, gingen am 6. im Stau der Nordalpen geringere Niederschläge, hingegen in den westlichen Landesteilen, namentlich im Nordseegebiet, recht ergiebige Schauer nieder. Die Regenfälle wiederholten sich unter vereinzelten Gewittererscheinungen und in stärkerer Auswirkung an der Nordsee, als eine von einem nordatlantischen Tief erzeugte Staffel feuchter Meeresluft am 7. und 8. über das Reichsgebiet nördlich des Hauptalpenkammes hinweglief und dabei in Gebirgslagen zu vereinzelten Schneefällen Anlaß gab. Die vom nordatlantischen Depressionsgebiet angesogene Warmluft führte am 9. in Norddeutschland zu weitverbreiteten Aufgleitregen; sie gingen am 10. in Schauer über, als aus nördlichen Breiten stammende Kaltluft südostwärts bis zur Linie Bodensee—Prag vorstieß. Gegenüber den in Norddeutschland gemessenen Tagesmengen, die sich vielfach auf 20 mm, an den Mittelgebirgen auf 30 mm beliefen, fielen südlich der Zentralalpen nur strichweise geringe Mengen. Ein am 12. über dem Alpengebiet entstehendes Hoch leitete nunmehr im Süden des Reiches zu anhaltend heiterer und trockener Witterung über, die mit schwachen Störungen am 19.—21. im allgemeinen bis zum 27. vorherrschte. Norddeutschland dagegen, besonders sein Küstenland blieb weiterhin der wechselnden Witterung der Westwinddrift ausgesetzt. Als nach subtropischer Luftzufuhr kältere böige Westwinde einsetzten, erhielt das Küstengebiet am 13. stärkeren Regen, der sich bis zum 14. über Norddeutschland ausbreitete; am 17. beschränkte sich eine von Westen aufziehende Störung mit ihren Regenfällen nur auf das nordwestliche Deutschland; desgleichen brachte am 18. und 19. die mit südwestlichen Winden vorstoßenden Warmluftmassen in Norddeutschland weitverbreitete gewittrige Schauerregen. Erst mit dem 20. unterband ein über Frankreich entstandenes Hoch die bisher störenden Eingriffe der Westwinddrift. Mit seiner Verlagerung nach Mitteleuropa fielen zwar bei Nordwestwinden meist noch geringe Niederschläge, an den Ostalpen sogar mäßig starke Stauregen, jedoch nahm die Witterung allgemein und damit auch für Norddeutschland trockenen und vielfach herbstlich-heiteren Charakte an. Erst nachdem das Hoch über Finnland sich langsam nach dem osteuropäischen Kontinent verlagert hatte und damit Mitteleuropa den Eingriffen von Süden kommender Depressionen preisgab, setzte Wetterverschlechterung ein. So verursachte am 25. ein vom Schwarzen Meer nordwärts ziehendes Tief in Ostpreußen Trübung und Niederschläge; ebenso kam es am 26. mit Annäherung einer Mittelmeerdepression südlich des Hauptalpenkammes zu anhaltenden und ergiebigen Regenfällen, die am 27. auf das nördliche Alpenland übergriffen und am 28. sich bis zum Main und den Sudeten, am 29. und 30. über ganz Norddeutschland verbreiteten. Die Niederschläge, die oberhalb 600 m teilweise als Schnee fielen, waren namentlich in Kärnten am 27. recht ergiebig und lieferten Tagesmengen von 35—45 mm. Die Annäherung eines Azorenhochs führte im Süden des Reiches schon am 30., in Norddeutschland erst am 31. Aufheiterung und Wetterbesserung herbei.

Im Bilde der Niederschlagsverteilung traten der Nordwesten des Reiches, ferner die Mittelgebirge des Westens und die Alpen mit ihren Erhebungen mit mehr als 75 mm Niederschlag hervor, ebenso im Osten neben den Sudeten der ostpommersche Höhenrücken und das nordöstliche Ostpreußen. Insbesondere stiegen die Monatsbeträge im nördlichen Schleswig-Holstein, im Oberharz, Bergischen Land, im Schwarzwald und in den Tauern noch über 150 mm an. Unter 50 mm Monatsniederschlag hatten das Gebiet der Oder und der unteren Weichsel, ferner das gesamte Donaugebiet in seinen flacheren Teilen, das in Bayern teilweise, in der Niederdonau dagegen in umfassender Weise weniger als 25 mm Niederschlag aufwies; in den Alpen waren wie in den großen Talzügen auch in Steiermark und in dem Kärntner Unterland die Mengen unter 50 mm geblieben.

Im Vergleich zu den langjährigen Durchschnittswerten war fast das gesamte Flachland mit Ausnahme Schlesiens und der Neumark und gewisser pommerscher und ostpreußischer Küstengebiete zu naß gewesen; namentlich im Nordwesten und Nordosten des Reiches waren teilweise mehr als das Doppelte gefallen. Während in dem südwärts sich anschließenden mitteldeutschen Berglande nur die Gebirge noch übernormale Beträge bis zu 150% verzeichneten, hatte der weitere Süden des Reiches durchweg unternormale Mengen erhalten, so daß Teile Bayerns und des Niederdonaugebietes, z. T. auch Kärnten und die Steiermark weniger als die Hälfte der normalen Menge verzeichneten.

Die Niederschlagshäufigkeit entsprach in großen Zügen der Mengenverteilung; sie schwankte im Nordwesten und Nordosten des Reiches zwischen 18 und 22 Regentagen und nahm schon im Bereich der thüringischen Saale, sonst erst in Süddeutschland auf 12, im Donaugebiet strichweise sogar bis auf 8 solcher Tage ab. Gewittertage waren in Norddeutschland vielfach mit 2 bis 3 merklich häufiger als im Süden des Reiches. Schneefall wurde im allgemeinen erst oberhalb 600 m beobachtet, im Thüringerwald und in den Sudeten schon in etwas tieferen Lagen. Eine vorübergehende Schneedecke bildete sich vereinzelt im Thüringerwald und in der Rhön, in größerer Ausdehnung im Schwarzwald; ebenso kam in den Alpen vornehmlich in den westlichen Teilen eine Schneelage zustande, meist erst in Höhen oberhalb 1000 m.



---

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊠) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (⊗) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um $7^h$ eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⌣) gibt die Gesamtmenge mehrerer Tage.

Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.

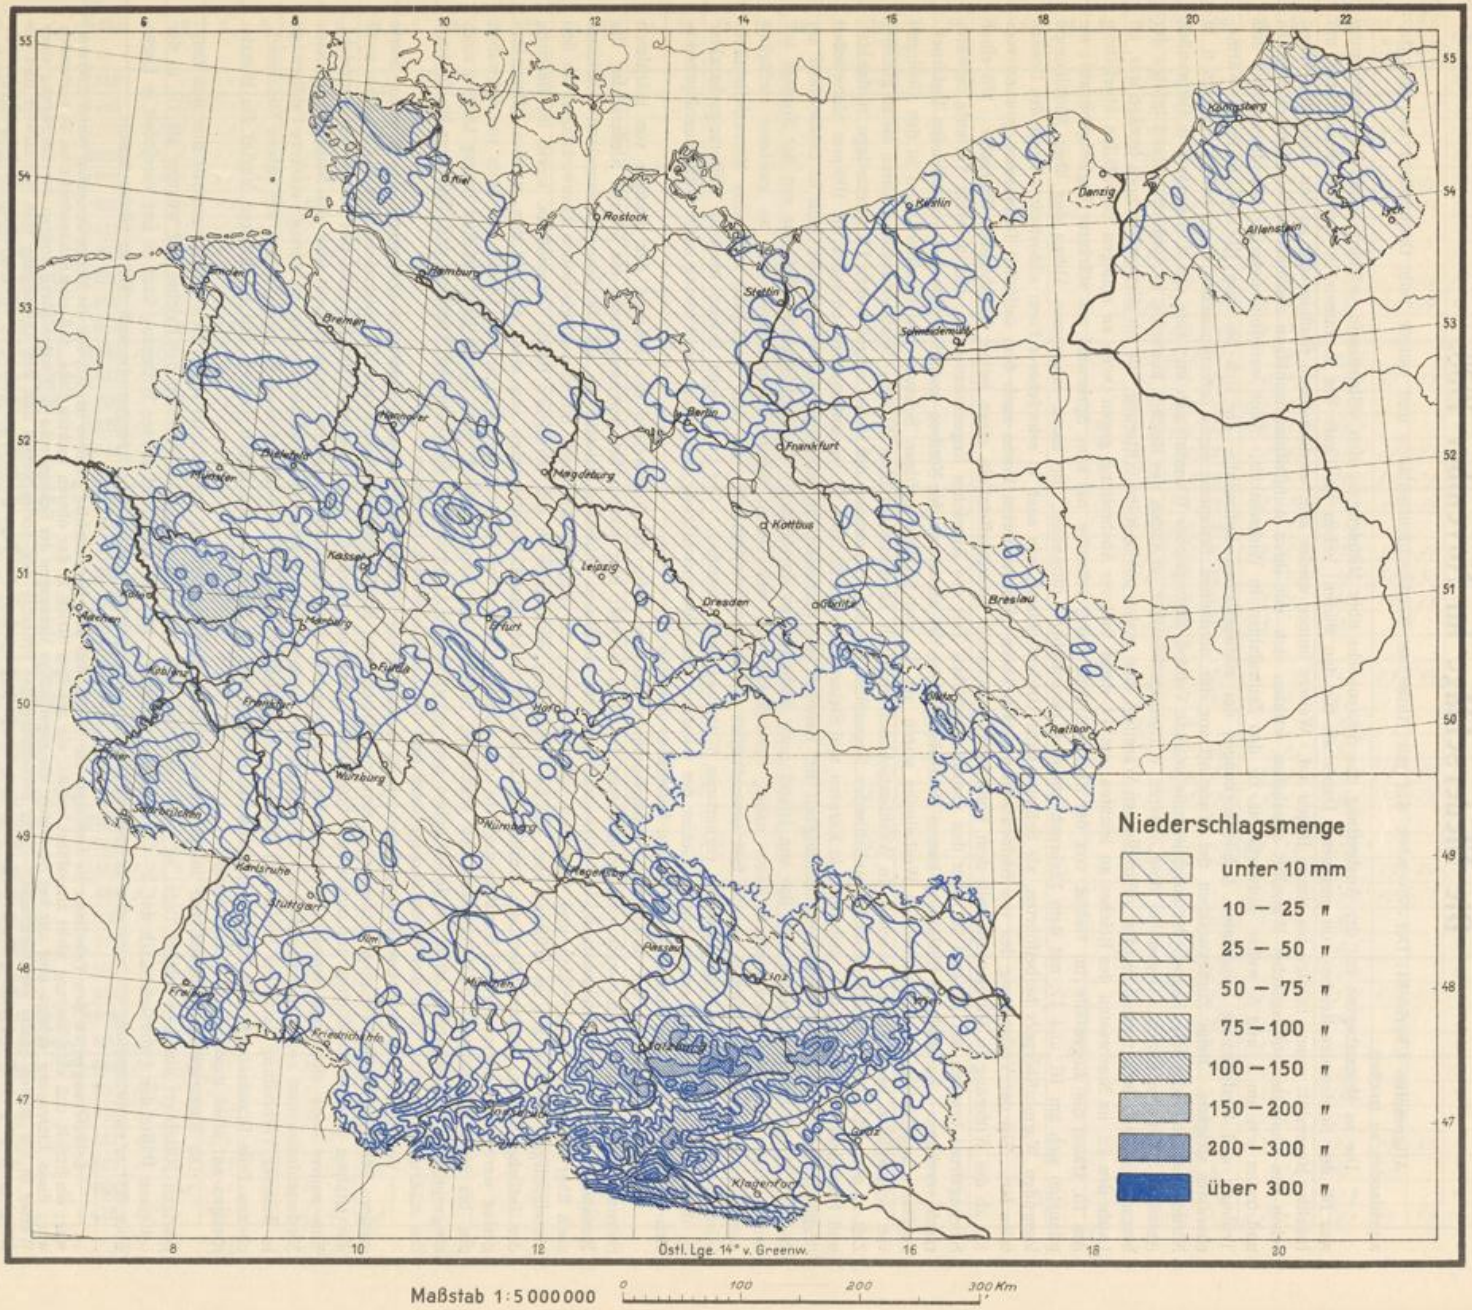
# Die Niederschläge im November 1938.

**Allgemeine Übersicht:** Der November war mit Ausnahme Nordwestdeutschlands und einiger Teile Ostpreußens und des Ostalpenlandes zu trocken.

Die zu Monatsbeginn mit der Ausbreitung des Azorenhochs über Mitteleuropa sich vollziehende Aufklarung und Wetterbesserung war für den Norden des Reiches von geringerer Dauer als für den Süden; schon im Laufe des 2. kamen in Nordwestdeutschland mit feuchter Meeresluft erneut mäßige bis starke Regen auf. Weitere immer wieder sich wiederholende Staffeln, die an den folgenden Tagen schon den Charakter subtropischer Warmluft annahmen, wirkten sich mit ihren Aufgleitniederschlägen zunächst in Norddeutschland aus und traten erst am 4. und 5. weiter südwärts bis zu den Zentralalpen in Wirksamkeit. Auch weiterhin unterlag Norddeutschland den Trübung und Niederschlag bringenden Aufgleitwirkungen der südwestlichen Luftzufuhr, die sich bis znm 13. noch in ihrem Wärmecharakter steigerte. Beim Zurückweichen der Warmluft vor der nördlichen Strömung eines osteuropäischen Tiefs fielen noch am 6. in Norddeutschland schwache Regen; der anschließende erneute Vorstoß subtropischer Warmluft gab im Laufe des 8. besonders in Ostpreußen Anlaß zu stärkeren Regen. Gegenüber dem heiteren Witterungscharakter im Süden des Reiches herrschte in Norddeutschland infolge der langsam ostwärts sich vorschiebenden subtropischen Warmluft eine etwas neblig-trübe Witterung, die im allgemeinen noch trocken war, im Laufe des 12. im Nordwesten des Reiches zu leichten, am 14. unter weiterer Ausbreitung gegen Osten zu mäßigen Regenfällen überleitete. Am 15. traten die Regenfälle im Gebiet von der Saar bis zum Harz, teilweise bis zum Spreewald mit stärkerer Ergiebigkeit auf; sie pflanzten sich am 16. und 17. mit dem Einbruch kühlerer ozeanischer Luftmassen, die einen langsamen Abbau des über Mitteleuropa lagernden Warmluftkörpers herbeiführten, als Schauer nach Ostdeutschland, wie auch in schwächerer Form südostwärts längs des Donautales fort. Mit der Verlagerung des von Süddeutschland nach Polen abgewanderten Hochs nach dem östlichen Donauraum gewann vom 18. ab die Witterung in Mitteleuropa mit dem Vordringen ozeanischer Meeresluftstaffeln einen immer unruhigeren Charakter. Mit einer Störungsfront brachen am 19. und 20. über den ganzen westlichen Teil des Altreiches Regenschauer ein, die in ihrem Verlaufe ostwärts rasch verebbten. Zu stärkerer Entfaltung kamen Meeresluftstaffeln, die einem von der Nordsee nach Südschweden vorstoßenden Tiefdruckausläufer angehörten; bei auffrischenden Westwinden waren am 21. und 22. ihre heftigen Schauer von Gewittern und in den Gebirgen von Schneefällen begleitet und brachten in Westdeutschland mehrfach Tagesmengen über 20 mm. Noch erheblicher waren die zu gleicher Zeit in den Alpenländern aufkommenden anhaltenden Regenfälle, die ihre Entstehung der dabei eingetretenen Föhnwetterlage verdankten und besonders auf der Südseite der Alpen in Kärnten und Steiermark zum 22. und 23. Gesamtmengen von mehr als 100 mm hinterließen (Naßfeldhütte 207.9 mm). Weitere Schauertätigkeit bei teilweise zur Sturmesstärke auffrischenden Westwinden kam in Deutschland am 23. und 24. mit einem Sturmtief auf, das von Island nach Südschweden durchbrach. Ein nachfolgendes Tief, das von der Nordsee aus seinen Weg längs der norwegischen Küste nahm, beschränkte sich mit seinen Schauerniederschlägen und zu gewisser Heftigkeit anwachsenden westlichen Winden am 26. fast ausschließlich auf Nordwestdeutschland. Mit dem Durchgang schwacher Meeresluftstaffeln blieb hier eine etwas trübe und zeitweilig regnerische Witterung noch bestehen. Der im übrigen Reiche trockene Witterungscharakter in den letzten Monatstagen erfuhr nur im Gebiet der Ostalpen eine Beeinträchtigung, wo unter der Wirkung einer Mittelmeerdepression sich Abkühlung, Trübung und schwache Regen bemerkbar machten.

In der Verteilung der Monatsniederschlagssummen trat vor allem der Nordwesten des Reiches, der häufiger von maritimen Störungsfronten heimgesucht wurde, mit reichlicheren Beträgen hervor; hier stiegen bei durchweg mehr als 50 mm Niederschlag die Monatsmengen an den Mittelgebirgen, in Ostfriesland und im nördlichen Schleswig-Holstein bis auf 100 mm, im Sauerland vereinzelt noch über 150 mm. Nach Süden und Osten zu nahmen sowohl die Mengen, wie auch die charakteristischen Stauwirkungen an den Mittelgebirgen merklich ab; sie erfuhren eine gleiche Ausprägung erst wieder in der nördlichen Hälfte Ostpreußens, sowie im Bereiche der östlichen Alpen, wo vor allem die nördliche Kalkalpenkette vereinzelt Monatsbeträge von mehr als 200 mm aufwies. Besonders gering waren dem gegenüber die Monatsmengen in den mittleren Teilen des Reiches; sie fielen in dem Gebiet, das etwa von Schwaben aus bis nach Brandenburg und Pommern sich erstreckte, teilweise auf weniger als 25 mm. Unter dem gleichen Betrag blieben auch ausgesprochen leegeschützte Lagen, zu denen neben dem schwäbischen Alpenvorland, dem Egerland, Vogtland und Thüringer Mulde auch das mährische Gesenke Teile des Niederdonaugebietes und die Untersteiermark rechneten.

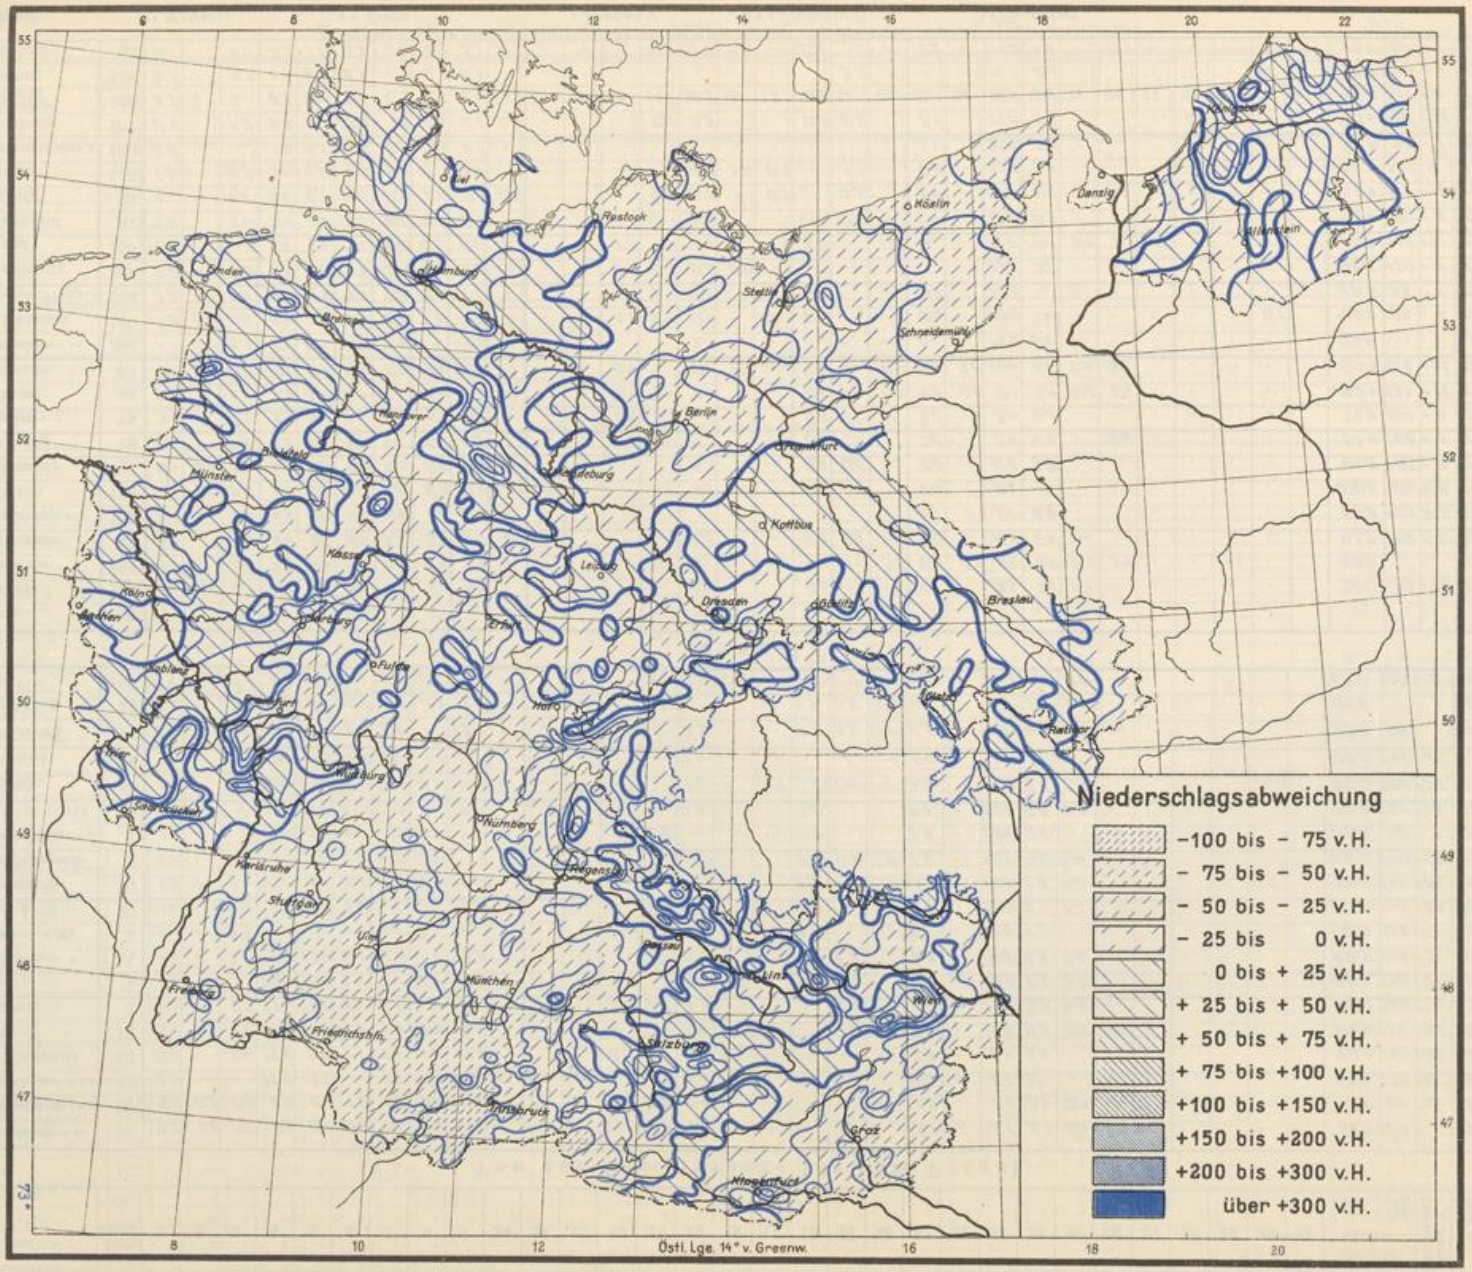
Verglichen mit dem langjährigen Durchschnitt hatten zuviel Niederschlag größere Gebiete im Nordwesten des Reiches sowie größere Teile Ostpreußens erhalten, ferner neben einzelnen Abschnitten des Bayerischen Waldes und des österreichischen Waldviertels noch die Ostalpen in ihren nördlichen und mittleren Gebirgsketten; vereinzelt wurde in diesen Gebieten das Doppelte des Normalwertes erreicht. Eine andere Zone allerdings schwach übernormaler Beträge verlief von der Halle—Leipziger Tieflandsbucht über die Niederlausitz nach Niederschlesien und von hier oderaufwärts. In den übrigen Reichsgebieten waren die gefallenen Mengen zu gering; stärkere Fehlbeträge in weiterer Verbreitung hatte der Süden des Altreiches einschließlich der Westhälfte der deutschen Alpen, ferner die untere Steiermark, ebenso Teile Brandenburgs und Pommerns; teilweise beliefen sich im Inntal, in den Hohen Tauern und im unteren Murtal die Monatsmengen auf nicht ganz ¼ der Normalmenge.



Die Niederschlagshäufigkeit war im Nordwesten des Reiches mit 20—22 Regentagen recht hoch und überschritt hier den langjährigen Mittelwert um 4—6 solcher Tage; sie nahm ost- und südwärts ab und ging im Südosten des Reiches auf weniger als 10, in der östlichen Hälfte der Untersteiermark auf 3—4 Regentage herunter. Bei der anhaltend milden Witterung kam es nur vereinzelt in Lagen über 600 m zu Schneefall, während eine Schneedecke sich vorübergehend erst in den Gebirgen oberhalb 800 m bilden konnte.

---

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊠) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (⊹) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um $7^h$ eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⁀) gibt die Gesamtmenge mehrerer Tage.



Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.
