# Die Niederschläge im Dezember 1938.

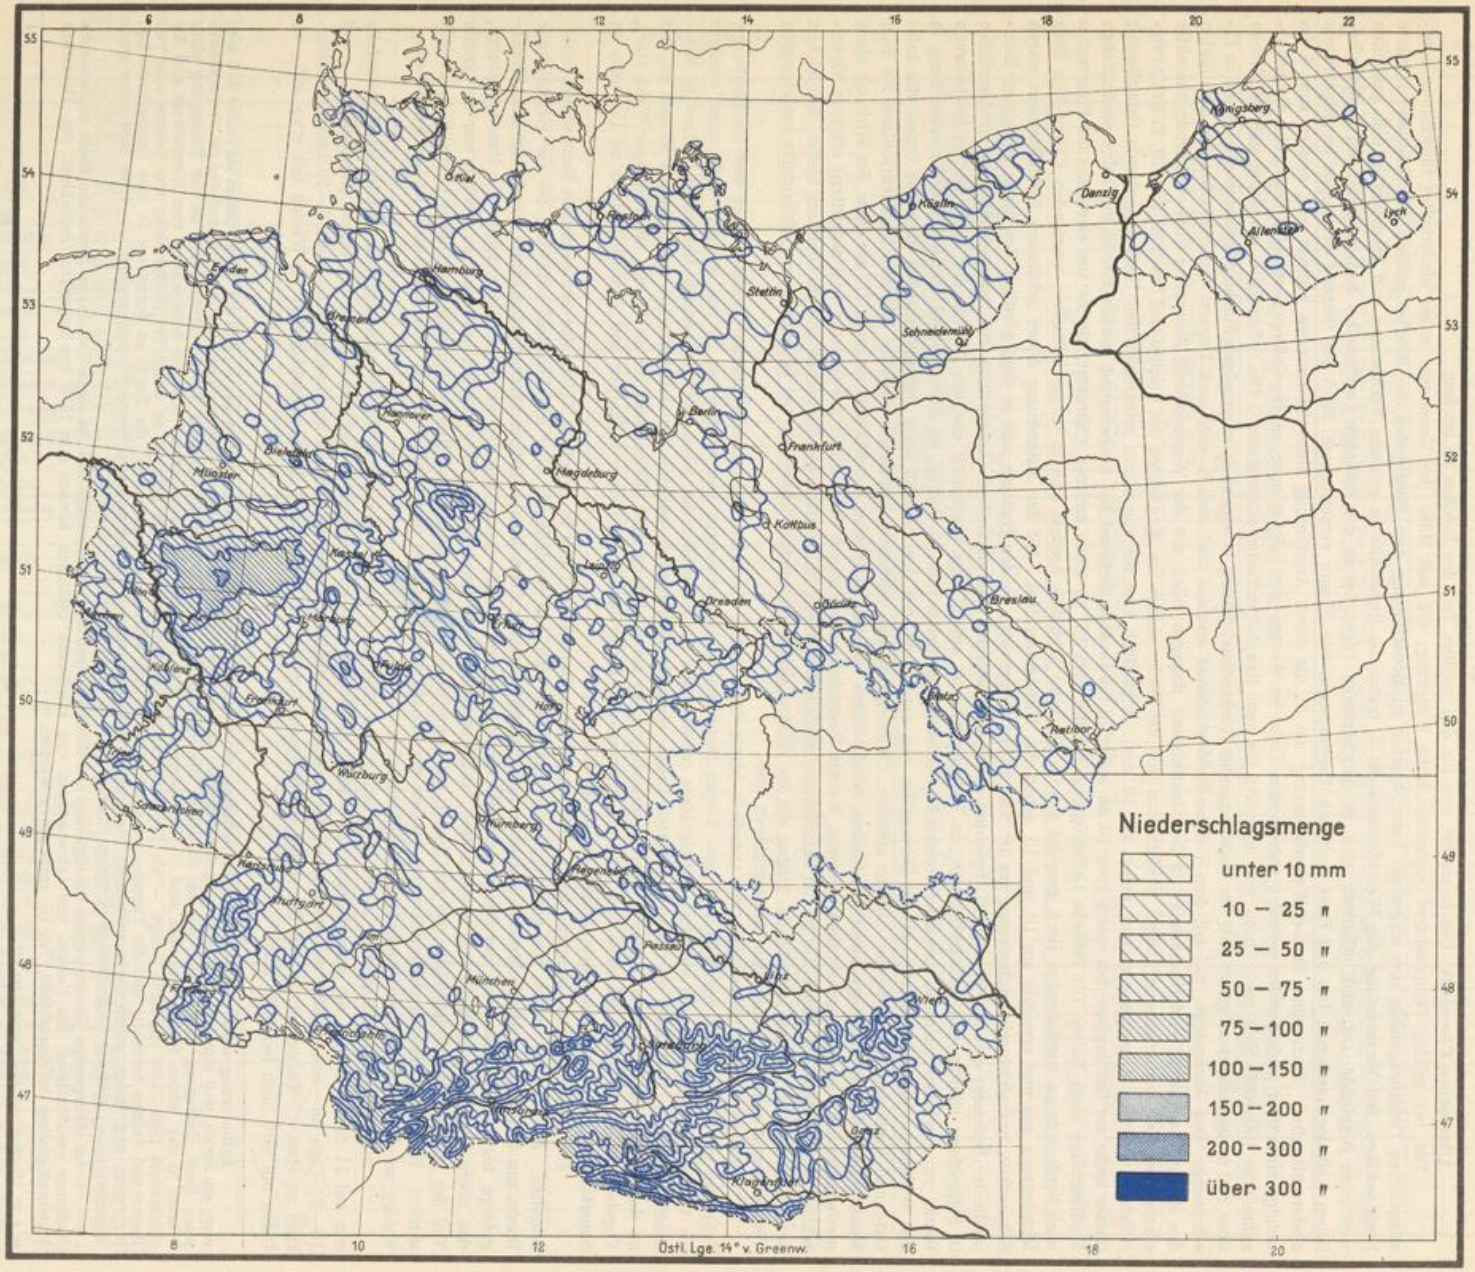
**Allgemeine Übersicht:** Der Dezember war für den größten Teil des Reiches zu trocken.

Die bei milden Temperaturen regnerisch-trübe Witterung, die seit Mitte des Vormonats unter wiederholter Einwirkung nordatlantischer Tiefdruckgebilde sich eingestellt hatte, brachte zu Monatsanfang dem Nordwesten des Reiches mäßige, im Sauerland stärkere Niederschläge. Bei Verschärfung der Westwinddrift am 3. traten die Regenfälle in größerer Verbreitung und Intensität in dem gesamten westlichen Berglande auf und pflanzten sich in den nächsten Tagen bis zu den östlichen Landesteilen fort; während am 5. die nördlichen Kalkalpen zwischen Inn und Enns mehrfach Tagesmengen von 25 mm verzeichneten, blieb der Ostrand der Alpen im allgemeinen niederschlagsfrei. Nach einer kurzen Wetterbesserung am 5., die durch Annäherung eines Azorenhochs bedingt war, setzten zum 6. im Gefolge eines über Südschweden ostwärts wandernden Tiefs im Westen des Reiches neue, an den Gebirgen ergiebige Regen ein, die mit abnehmender Intensität sich nach Osten und südwärts bis zum Hauptalpenkamm ausbreiteten. Die Schneefälle, die dabei sich auf Höhen über 800 m beschränkten, traten mit der aufkommenden Rückseitenströmung bereits auch in einzelnen Flachlandgebieten des Ostens in Erscheinung. Das Azorenhoch, das mit dem 7. über Süddeutschland erschien und zum 8. sich nach Ungarn verlagerte, brachte dem Süden des Reiches langsame Wetterbesserung; in Norddeutschland dagegen blieb mit der Westwinddrift der neblig-trübe Witterungscharakter einstweilen noch vorherrschend. Dabei wiederholten sich die Niederschläge im Nordwesten des Reiches und brachten zum 10. in Schleswig-Holstein mehrfach Tagesmengen von mehr als 10 mm. Schließlich kam die von einem osteuropäischen Hoch ausgehende Ostströmung immer mehr zur Geltung, so daß schon vom 10. ab selbst in Nordwestdeutschland bei überwiegend starker Bewölkung keine wesentlichen Niederschläge mehr fielen. Die östliche Luftströmung gewann vom 15. ab einen anderen Charakter, als sie von einem aus der Polarregion nach Nordosteuropa vorstoßenden Hoch gespeist wurde; die kalte Arktikluft breitete sich in immer intensiver werdenden Kältewellen über Mitteleuropa aus und erreichte am 18. und 19. schon das Mittelmeergebiet. Mit der Ausbreitung dieser arktischen Kaltluftmassen waren Schneefälle nur strichweise aufgetreten am 16. und 18. in Ostpreußen, an den Sudeten und in dem nördlich der Alpen gelegenen Berglande der Ostmark; erst am 20. und 21. brachten geringe Schneefälle eine wesentliche Ausbreitung der Schneedecke. Die Niederschläge in Schneeform häuften und verstärkten sich, da Tiefdruckgebiete, am 22. von Frankreich aus, am 23. von der Adria her, in Mitteleuropa Raum zu gewinnen suchten; besonders reichliche Niederschläge fielen vom 20. bis 23. im Kärntnerland. Nach kurzer Unterbrechung in den Weihnachtsfeiertagen setzten erneut Schneefälle ein, als am 26. mit dem Vorstoß einer Balkandepression nach der Ostsee die kalte Ost- und Nordostströmung wieder stärker auflebte. Während an den Südalpen, schließlich auch im östlichen Norddeutschland bis zum Monatsschluß die Niederschläge bereits ausblieben, wiederholten sie sich im Westen des Reiches, wo vom 27. ab unter der Wirkung eines nordatlantischen Depressionsausläufers wärmere, feuchte Meeresluftmassen gegen die Kaltluft anbrandeten und aufglitten; stärkere Niederschläge gingen dabei im Laufe des 27. im linksrheinischen Schiefergebirge, im westfälischen Berglande und am Oberharz nieder, desgleichen am 28. im Allgäu. Gegen Monatsende gingen die im Westen sich fortsetzenden Schneefälle bei langsam zum Gefrierpunkt ansteigenden Temperaturen schon zu nässenden Niederschlägen über.

Infolge starken Überwiegens der Ostwinde hatten Ostpreußen, Pommern, die östlichen Hälften Brandenburgs und Mecklenburgs, Schlesien mit Nordmähren, teilweise auch das Wiener Donaubecken Monatsmengen von weniger als 25 mm, kleinere Teile sogar weniger als 10 mm; wie die Leelagen einzelner Mittelgebirge wiesen auch die Haupttäler der Alpen derartig geringe Mengen auf. Erst in Nordwestdeutschland, z. T. auch in Ober- und Mittelfranken, sowie in Niederbayern nahmen die Monatsbeträge auf mehr als 50 mm zu, um an den Höhen der Gebirge zu größeren Werten anzusteigen, so am Erzgebirge und Böhmerwald bis zu 75 mm, im Thüringer Wald, Harz, Vogelsberg, in der Eifel, Schwäbischen Alb, im Schwarzwald, ferner in den nördlichen Kalkalpen und Zentralalpen bis zu 150 mm, im Sauerland und im westlichen Kärntnerland bis gegen 200 mm.

Die Monatsmengen konnten damit den langjährigen Durchschnitt nur in einzelnen Teilen der südwestlichen Reichshälfte überschreiten. Ein solches Gebiet von größerer Ausdehnung zog sich von Nordböhmen über das Vogtland nordwärts bis zur Magdeburger Börde, um in einzelnen Abschnitten bis zur Unterelbe sich fortzusetzen; übernormale Mengen verzeichneten ferner das Gebiet vom Siebengebirge bis zur Ruhrmündung, der Steigerwald, die Umgebung von Kassel, ebenso wie die von Regensburg, ferner die Mannhardsberge, das obere Einzugsgebiet der Drau, sowie Mittel- und Untersteier. Mit weniger als 50% des Normalwertes zu trocken war der größte Teil der nordöstlichen Reichshälfte, wo am Pregel, am Isergebirge, in Oberschlesien und Mähren teilweise noch nicht einmal 25% erreicht wurden. Unter 50% des Durchschnittswertes blieben die Monatsbeträge auch in den nördlichen und mittleren Alpen, im Lee des Schwarzwaldes, an der Hardt und im Saarbrückener Kohlenrevier.

Die Niederschlagshäufigkeit belief sich östlich der Elbe meist auf weniger als 10 Niederschlagstage, im Ostalpenland gleichfalls nur auf 11 solcher Tage; sie stieg dagegen im Westen des Reiches — mit häufigeren Niederschlägen in der ersten Monatshälfte — auf 18—22 Tage an. Schneefälle, die vorwiegend der zweiten Monatshälfte angehörten, traten im Flachlande an etwa 6—10 Tagen, im Bergland an etwa 13 Tagen auf, so daß der Anteil der Schneefalltage an der Gesamtzahl der Niederschlagstage im Westen mit etwa 40%, im Osten mit 60% sich beziffern läßt.



---

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0.0, daß die Menge unmeßbar (unter 0.05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um $7^h$ vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (⊗) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (✳) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0.1 mm betrug, als Tage mit ⊠ die Tage, an denen um $7^h$ eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte ( ) sind ergänzt. — Eine Zahl unter einer Klammer (⌣) gibt die Gesamtmenge mehrerer Tage.

Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem 1939 erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1938, Teil III, entnommen werden.

Anordnung der Stationen nach Flußgebieten

# Die Schneedecke im Januar 1938.

**Allgemeine Übersicht:** Infolge des starken Frostwetters, das unter Schneefällen in den letzten Tagen des Vormonats sich bis nach den Mittelmeerländern ausbreiten konnte, lag zu Beginn des Januar fast in ganz Deutschland Schnee; nur vereinzelte geschützte Tallagen im Rheingebiet waren es, die erst mit den Niederschlägen des 1. eine Schneebedeckung erhielten. Da gegenüber einem schottischen Hochdruckgebiet finnländische Depressionen am 1., wie auch am 4. nach Ostdeutschland eingriffen, brachten die dabei auftretenden verbreiteten Schneefälle bereits eine merkliche Erhöhung der Schneelage. Nach einer wesentlichen Verschärfung des Frostes bis auf 12—14° unter Null, die auf den Flüssen Eisstand, auf der Ostsee Treibeisfelder und an ihren Küsten Packeisbildungen im Gefolge hatten, setzten am 6. mit einer plötzlich einsetzenden Westnordwestströmung umfangreiche und ergiebige Aufgleitschneefälle ein, die vielfach (in Mitteldeutschland und in Ostpreußen) zu verkehrshemmenden Verwehungen Anlaß gaben; auf den Höhen des nördlichen Schwarzwaldes und der Alpen war die Anreicherung an Schneemassen so stark, daß die größten Schneedeckenhöhen des Monats schon in diesen Tagen erreicht wurden. Mildere Meeresluftmassen, die von Westen nachfolgten, leiteten im Flachlande bereits unter wiederholten Aufgleitregen einen langsam ostwärts vorschreitenden Abschmelzprozeß ein, sodaß am 7. große Teile des nordwestlichen Flachlandes einschließlich Schleswig-Holstein und am 9. ganz Hannover nördlich der Mittelgebirgsschwelle wieder schneefrei war. Die Niederschläge dieser Tage, die durch das stete Andringen der Westluft gegen die Kaltluftmassen hervorgerufen waren, erhöhten die Schneedecke namentlich in den höheren Lagen der deutschen Mittelgebirge bis zum 11. und 12. vielfach von neuem, teilweise bis zu ihrem Höchstwert im Monat. Schließlich führte die mit den Westwinden vorgetragene und sich verstärkende Erwärmung auch im Bergland zu Tauwetter. Nachdem in den tieferen Lagen des Rhein- und Weserberglandes bis zum 10., in der Rheinpfalz schon zum 9. der Schnee verschwunden war, vollzog sich unter ergiebigen Regenfällen bis zum 13. und 14. ein rascher Abbau der Schneedecke bis zu 400 m und in den folgenden Tagen bis zum 18. noch bis zu 600 m Höhe hinauf. Nur die höheren Erhebungen bewahrten sich bis zum Monatsende eine, wenn auch vielfach zusammengeschmolzene Schneedecke: der Schwarzwald oberhalb 800 m, die Gebirge westlich der Elbe oberhalb 700 m, die sonstigen böhmischen Randgebirge oberhalb 600 m, vereinzelt auch wie in den südlichen Sudeten oberhalb 500 m. Im Osten, wo die Erwärmung schon am 12. über die Weichsel, am 13. über die Memel hinaus vorstoßen konnte, verschwand die Schneedecke am 16. und 17., im mittleren Ostpreußen erst am 23. und 24., während sie im litauischen Grenzbezirk ihren Bestand bis zum Monatsschluß zu sichern vermochte. Der fortgesetzte warme Witterungsverlauf brachte einstweilen nur noch Regenfälle; eine Neuschneelage bildete sich nur gelegentlich und vereinzelt an den Gebirgshängen. Nach kurzer Wetterberuhigung am 15. und 16. kam es am 17. und 18., ebenso am 21. mit vorstoßenden ozeanischen Warmluftfronten zu verbreiteten und ergiebigen Niederschlägen, die oberhalb 500 m vereinzelt Neuschnee hinterließen. Da ein am 20. nach Süddeutschland vorrückender azorischer Hochdruckausläufer langsam seinen Einfluß erweiterte, beschränkte sich die Wirkung weiterer Warmluftstaffeln immer mehr auf Norddeutschland, wo am 24. nochmals in den Gebirgen vorübergehend Neuschnee sich zeigte. Erst mit einem am 27. von Westen aufziehenden Depressionsausläufer gingen die Niederschläge mit den langsam auf Nordwest drehenden Winden wieder zu verbreiteten Schneeschauern über. Dabei entstand mit dem 28. und 29. vielfach eine Schneedecke, die nur im Berglande oberhalb 400 m, im Westen oberhalb 600 m bis zum Monatsende Bestand hatte; in diesen Höhenlagen vermochten die in den letzten Tagen auftretenden Westluftstaffeln mit ihren Niederschlägen die neuentstandene Schneedecke wieder auf eine Höhe von 30—40 cm zu bringen.

Die Andauer der Schneedecke war im Januar stark eingeschränkt durch die warme Witterung, die am 6. mit der Westwinddrift bereits am Rhein einsetzte und zum 13. sich bis zur äußersten Nordostgrenze Geltung verschaffte. Damit erstreckte sich im Flachlande der Bestand der Schneedecke am Rhein und an der Ems auf etwa 7 Tage, an der mittleren Elbe auf 11, an der Oder auf 15 und an der Weichsel auf etwa 18 Tage, um im östlichen Ostpreußen auf 31 Tage zuzunehmen. Etwas länger hielt sie sich in den niedrigereren Lagen des Berglandes, am Rhein etwa 8—9 Tage, im übrigen bis zu 13 und 14 Tagen; ein Dauerbestand während des ganzen Monats blieb ihr gesichert in Höhen über 800 m im Schwarzwald und Rothaargebirge, sonst in Höhen über 600—700 m, in den Sudeten z. T. auch noch oberhalb 500 m.

Die Höhe der Schneedecke erfuhr bis zum 7., vielfach noch bis zum 12. eine stetige Zunahme; dabei sind die beobachteten Mächtigkeiten vielfach recht kennzeichnend für den Niederschlagsreichtum der abgelaufenen winterlichen Frostperiode Die größte Höhe zeigte sich im Osten bereits in den Tagen des 7. und 8., sonst am 11. und 12. In Ostpreußen wurden Schneehöhen von 30—40 cm erreicht, in der schlesischen Ebene, in Pommern und Grenzmark von 25—30 cm und im mittleren Norddeutschland von 20—25 cm; im nordwestlichen Flachlande gingen sie nur vereinzelt über 15 cm hinaus. In Gebirgslagen war bis zu 400 m Höhe eine maximale Schneehöhe von 35—40 cm die Regel; sie stieg in 500 m auf etwa 50 cm, in 800 m schon auf 75 cm und in 900 m vereinzelt auf 100 cm. In den höheren Lagen, wo der Schnee zwar erhalten blieb, sank sie vom 13. ab mehr oder weniger stark zusammen; ihre Anreicherung durch die nachfolgenden Niederschläge war an den Gipfelstationen so stark, daß am Monatsschluß die größte Schneedeckenhöhe des 12. erreicht oder noch überschritten wurde; so belief sich die Mächtigkeit der Schneemassen auf dem Feldberg im Schwarzwald auf 110 cm, am Herzogstandhaus auf 140 cm, am Blomberghaus und auf dem Brocken auf rd. 170 cm, ferner auf dem Predigtstuhl, an der Traunsteinerhütte und am Wendelsteinhaus auf rd. 250—270 cm, am Hochgernhaus und Nebelhorn auf mehr als 300 cm, an der Zugspitze auf 520 cm.

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß eine Schneedecke nicht gelegen hat; Fl., daß einzelne Schneeflecke vorhanden waren; 0, daß eine sehr dünne oder eine stellenweise durchbrochene, aber noch zusammenhängende Schneedecke gelegen hat; ⊠, daß eine Schneedecke vorhanden war, deren Höhe nicht gemessen wurde; ein Strich oder ein freies Feld, daß eine Beobachtung nicht stattgefunden hat.

# Die Schneedecke im Februar 1938.

**Allgemeine Übersicht:** Infolge des recht milden Witterungsverlaufs im Vormonat beschränkte sich die Schneedecke zu Monatsbeginn nur auf gewisse Teile Ostpreußens und auf die höheren Lagen der Gebirge, in denen die Schneegrenze nach den Schneefällen des 28. und 29. Januars sich von 600—800 m Höhe vorübergehend noch um 200 m tiefer verlagert hatte. Das zunächst weiter anhaltende milde Wetter der ersten Februardekade ließ bei der Westwinddrift den Schneedeckenbereich langsam zurückgehen, trug aber auf den Gipfeln des westlichen Berglandes etwa bis zur Mulde-Elbe mit den Niederschlägen des 1. und 2. als Schnee stark zur Erhöhung der Schneelagen bei. Im Flachlande wurde mit der am 4. eintretenden Erwärmung bei Ausbreitung eines azorischen Hochdruckausläufers auch der Nordosten des Reiches, der sich bisher noch eine schwache Schneedecke bewahrt hatte, fast ganz schneefrei. Bis zu der am 10. mit Einbruch arktischer Luftmassen und unter Schneefällen beginnenden Periode winterlicher Witterung blieben die Schneelagen nur erhalten in Höhen über 500 m im Osten und oberhalb 700—800 m im Westen.

Die teilweise am 10. einsetzenden und bis zum 14. anhaltenden recht ergiebigen Niederschläge (s. Niederschlagsbericht), die alsbald in Schneefall übergingen und im Schwarzwald, vereinzelt auch im Böhmerwald Tagesmengen von mehr als 50 mm brachten, hinterließen bereits am 10. im Berglande wie auch im östlichen Flachlande eine Schneedecke, die mit Ausbreitung arktischer Luft und unter anhaltenden Schneefällen der folgenden Tage sich auch über das mittlere und westliche Flachland ausbreitete. Wenn auch in der anschließend heiteren Witterungsperiode vom 15. ab tagsüber sich die Sonnenstrahlung als recht wirksam erwies, so wirkten die nächtlichen Frosttemperaturen, die meist auf 6—8° unter Null heruntergingen, nach Möglichkeit für die Erhaltung der Schneelagen. Immerhin schwand der Schnee in den niederen Lagen des Westens nach 4—5 Tagen seines Bestehens, im übrigen Flachlande erst in den Tagen vom 17.—20.; selbst der Osten, der vom 17. ab unter der Wirkung einer osteuropäischen Depression von recht milden maritimen Luftmassen überflutet wurde, machte dabei keine Ausnahme. Leichte Schneefälle noch am 20. und 22., sowie am 23. in Ostdeutschland am Rande polarer Depressionen vermochten keine wesentliche Änderung in der Schneedeckenverbreitung herbeizuführen. Vom 24. ab wich unter langsamer Temperatursteigerung mehr und mehr der winterliche Witterungscharakter, so daß der Schmelzprozeß auch an den Gebirgen einsetzte. Die Verschiedenartigkeit der Schneeanhäufung nach den niederschlagsreichen Tagen vom 11.—14. brachte es mit sich, daß die untere Grenze der bis zum Monatsende bestehenden Schneedecke starke Ungleichmäßigkeiten zeigte; im allgemeinen lag sie im Osten bei etwa 500 m, im Fichtelgebirge, Böhmerwald und im östlichen Teil der bayerischen Alpen bei rund 600 m und im Westen z. T. noch über 650 m Höhe.

Oberhalb dieser angegebenen Grenzen hatte auch im Januar die damals z. T. stark angewachsene Schneelage durchhalten können; zum Überblick sei daher in großen Zügen der Beginn einer bis Ende des Februar andauernden Schneedecke kurz gegenübergestellt: ab 10. September auf der Zugspitze; — ab 10. oder 11. November in den Allgäuer Alpen oberhalb 1500 m, in den östlichen bayerischen Alpen oberhalb 1000 m, z. T. auch in den Sudeten oberhalb 700 m; — ab 25.—27. November in den Allgäuer Alpen oberhalb 1000 m, in den mittleren bayerischen Alpen (Isargebiet) oberhalb 700 m, im Böhmerwald oberhalb 500 m, in den Sudeten und nordböhmischen Grenzgebirgen oberhalb 700 m; — ab 6.—8. Dezember in den Alpen oberhalb 700 m, im Schwarzwald, auf der Schwäbischen Alb, im Taunus und auf der Rhön oberhalb 700—800 m, in allen übrigen deutschen Mittelgebirgen oberhalb 600 m; — ab 26. Dezember im Thüringerwald und Erzgebirge oberhalb 500 m.

Die maximalen Höhen der Schneedecke entfallen fast ausnahmslos auf die Periode der niederschlagsreichen Tage vom 11.—14. Während im Flachlande des westlichen und mittleren Norddeutschlands eine Höhe von 15 cm kaum überschritten wurde, erreichte sie in Ostpreußen vereinzelt mehr als 30 cm. Solche Lagen an Schnee waren sonst nur an den deutschen Mittelgebirgen anzutreffen, die in etwa 650 m Erhebung meist 50 cm, in 900 m Höhe schon 1 m starke Schneedecken aufwiesen. Eine besondere Mächtigkeit von 2 m Höhe und darüber verzeichneten zeitweise Brocken (mit 245 cm), Hornisgrinde im Schwarzwald (200 cm), Balderschwang (215 cm), Nebelhorn (460 cm), Herzogstandhaus (200 cm), Zugspitze (690 cm), Wendelsteinhaus (320 cm), Hochgernhaus (320 cm), Traunsteinerhütte (275 cm) und Predigtstuhl (321 cm).

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß eine Schneedecke nicht gelegen hat; Fl., daß einzelne Schneeflecke vorhanden waren; 0, daß eine sehr dünne oder eine stellenweise durchbrochene, aber noch zusammenhängende Schneedecke gelegen hat; ☒, daß eine Schneedecke vorhanden war, deren Höhe nicht gemessen wurde; ein Strich oder ein freies Feld, daß eine Beobachtung nicht stattgefunden hat.

# Die Schneedecke im März 1938.

**Allgemeine Übersicht:** Zu Monatsbeginn war nur noch in den Gebirgslagen eine Schneedecke vorhanden, deren Untergrenze von Osten nach Westen von 500 m bis über 600 m leicht anstieg. Bei dem außergewöhnlich warmen und trockenen Witterungscharakter des März kam es nur ganz selten zur Neubildung einer Schneedecke, während die alte Schneedecke unter dem Einfluß der starken Sonnenstrahlung sowie der hohen Lufttemperaturen rasch abschmolz.

Nach einer längeren Periode milder westlicher Luftströmungen aus einem über Frankreich befindlichen Hochdruckkern brachten die am 10. auf der Rückseite eines über Mittelschweden ostwärts ziehenden Tiefs einbrechenden kälteren Luftmassen den höheren Teilen des nordost-deutschen Tieflandes, insbesondere den pommerschen und ostpreußischen Höhenzonen, eine Neuschneedecke, ebenso auch den gesamten Sudeten sowie ihrem Vorlande und den höheren Lagen des Erzgebirges. Jedoch brachte die vom 12. ab, besonders aber nach dem 14. einsetzende, für die Jahreszeit sehr bezeichnende Schönwetterlage bei starker Einstrahlung erneut ein Abschmelzen der Schneedecke, die sich nur in kaum bewohnten Hochlagen den ganzen Monat über halten konnte.

Erst als diese, in diesem Jahre besonders stark ausgeprägte und lang anhaltende Periode warmen und sonnigen Hochdruckwetters am 26. durch eine scharfe Kaltfront mit nachstoßenden arktischen Luftmassen abgeschlossen wurde, kam es in allen Mittelgebirgen zur Bildung einer Neuschneedecke, die bis zu 15—20 cm erreichte und in den Hochlagen teilweise überschritt. Aber schon die am 28.—29. aus Südwesten her vorstoßenden wärmeren Luftmassen brachten die gefallenen Neuschneemengen in kurzer Zeit zum Abschmelzen. So waren gegen Ende des Monats die Schneelagen beschränkt auf die Höhen der Alpen, des Schwarzwaldes, des Bayrisch-Böhmischen Waldes, sowie der höchsten Erhebungen von Harz, Erzgebirge, Riesen- und Isergebirge. Die Angabe einer Untergrenze in den einzelnen Gebirgen ist deshalb schwer, da — trotz der in entgegengesetztem Sinne wirksamen Auslage — die niederschlagreichsten Gebiete auf der Südabdachung der Mittelgebirge sowie in den Bayrischen Alpen ihre Schneedecke länger behielten als die übrigen. Im allgemeinen verlief die Schneegrenze gegen Ende des Monats in einer Höhe von 1000—1100 m im Südwesten des Reiches bis herab auf etwa 600—700 m in den Sudeten.

Die größten Höhen der Schneedecke lagen zu Beginn des Monats in sämtlichen Mittelgebirgen unter 2 m (Brocken 185 cm) und sanken im Laufe des Monats auf unter 1 m. Während in den Hochlagen der Bayrischen Alpen die Schneehöhen zu Beginn des Monats noch 2 m an vielen Stellen überschritten (Zugspitze 560 cm, Nebelhorn 360 cm, Wendelstein 265 cm usw.), unterschritten sie gegen Ende des Monats in allen Höhen unter 1800 m die genannte Schwelle und hielten sich nur in den höchsten Gipfellagen (Zugspitze 530 cm) annähernd auf der alten Höhe.

---

**Erläuterungen zu den Tabellen:** Es bedeutet: ein Punkt, daß eine Schneedecke nicht gelegen hat; Fl., daß einzelne Schneeflecke vorhanden waren; 0, daß eine sehr dünne oder eine stellenweise durchbrochene, aber noch zusammenhängende Schneedecke gelegen hat; ⊠, daß eine Schneedecke vorhanden war, deren Höhe nicht gemessen wurde; ein Strich oder ein freies Feld, daß eine Beobachtung nicht stattgefunden hat.
