Jahresmittel von Luftdruck, Temperatur, Dampfdruck, Relativer Feuchtigkeit, Windgeschwindigkeit, Abkühlungsgröße, Sonnenscheindauer, Luftelektrischem Potentialgefälle und Leitfähigkeit, Bodentemperatur	90
Zusammenstellung von Monats- und Jahreswerten	90
Wind (Häufigkeit der 16 Richtungen, Windwege für die einzelnen Richtungen)	90
Niederschlag (Monatliche Niederschlagsmenge für jede Stunde, Gesamtdauer des Niederschlags in Stunden, Häufigkeit der einzelnen Niederschläge nach Stunden- werten der Menge, Häufigkeit der einzelnen Nieder- schläge nach Stufenwerten der Dauer)	91
Absolute Extreme	92

Einleitung

Mit der vorliegenden Veröffentlichung der Beobachtungen und Registrierungen am Meteorologischen Observatorium des Reichsamtes für Wetterdienst in Wahnsdorf werden die im Deutschen Meteorologischen Jahrbuch 1937, Teil IV, Heft 2, veröffentlichten „Beobachtungen des Observatoriums Wahnsdorf“ fortgesetzt. Inhalt und Umfang sind gegen das Vorjahr etwas verändert.

Neu hinzugekommen sind die Messungen der Verdunstung (zu jedem Morgentermin) mit einer Verdunstungswaage nach Wild.

Die Terminbeobachtungen sind im Teil I des Jahrbuches abgedruckt.

Von den hier veröffentlichten Registrierungen beziehen sich Luftdruck, Lufttemperatur, Luftfeuchtigkeit, Dampfdruck und lufterlektrische Leitfähigkeit auf die Angaben zur vollen Stunde.

Die Werte für Windrichtung, Windgeschwindigkeit, Abkühlungsgröße und lufterlektrisches Potentialgefälle sind Stundenmittel. Alle Registrierungen sind, soweit nicht anders vermerkt, nach mittlerer Ortszeit ausgewertet worden.

Unsichere und interpolierte Werte sind kursiv gedruckt.

Zur Erläuterung dienen nachstehende Hinweise:

1. **Luftdruck.** Die Stundenwerte sind den Aufzeichnungen des Fießschen Aneroidbarographen Nr. 124479 mit Tagesumlauf entnommen und werden durch Vergleichsbeobachtungen (5mal täglich) auf das Fießsche Stationsbarometer Nr. 2294 reduziert.

2. **Lufttemperatur und Luftfeuchtigkeit.** Die Meßgeräte sind auf der Beobachtungswiese in einer Schreiberschen Hütte 2,5 m über dem Erdboden aufgestellt. (Vom 8. VI. bis 13. VI. wurde die Hütte neu angestrichen und die betreffenden Registrierungen und Ablesungen wurden solange in einer RfW-Hütte mit einfachen Jalousien vorgenommen.) Die Terminwerte von Temperatur und Feuchte werden mit einer Thermometeraufstellung bestimmt, deren feuchtes Thermometer seit 1936 mit künstlicher Ventilation versehen ist. Alle Feuchteangaben sind auf das aspirierte Psychrometer reduziert. An Registriergeräten waren vorhanden: 1 Fießscher Thermograph und 1 Lambrechtscher Hygroph mit Tagesumlauf, und 1 Fießscher Thermograph und 1 Fießscher Hygroph mit Wochenumlauf.

Die Verdunstungswaage ist in einer Lüdelingschen Hütte mit einfachen Jalousien aufgestellt.

3. **Windmessung.** — Windrichtung und Windgeschwindigkeit sind den Aufzeichnungen des Fießschen Universalapparates Nr. 2855 entnommen. Der Apparat ist auf dem Turm des Observatoriums aufgestellt, sein Schalenkreuz befindet sich in 25 m Höhe über dem Erdboden.

Die Registrierung der Windgeschwindigkeit in 2,5 m über dem Erdboden erfolgte bis 13. IV. mit einem Fießschen Kontaktanemometer mit 4teiligem Schalenkreuz, ab 20. IV. mit einem Rosenmüllerschen Kontaktanemometer mit 3teiligem leichten Schalenkreuz. Das Anemometer ist auf der Instrumentenwiese aufgestellt und an einen Fießschen Chronographen angeschlossen.

4. **Niederschlagsmessungen.** Der Niederschlag wurde mit einem Hellmannschen Regenmesser (Auffangfläche 200 cm²) gemessen. Daneben werden noch Vergleichsmessungen mit einem Schreiberschen Regenmesser (Auffangfläche 500 cm²) vorgenommen.

Zur Registrierung diente ein heizbarer registrierender Regenmesser nach Hellmann, Bauart Fieß.

5. **Sonnenscheindauer.** Die Aufzeichnung der Sonnenscheindauer erfolgte mit einem Sonnenscheinauto-graphen nach Campbell/Stokes.

6. **Erdbodentemperaturen.** Die Bestimmung der Erdbodentemperaturen erfolgte auf 2 Meßständen der Instrumentenwiese. Der eine Meßstand befindet sich in lehmigem Kies, der an der Oberfläche eine Sandschicht trägt und von Pflanzenwuchs völlig freigehalten wird.

Der andere Meßstand ist mit kurzgehaltenem Rasen bedeckt. Von beiden Meßständen wird im Winter eine etwa vorhandene Schneedecke entfernt. — Am 20. IV. 38 wurde der Meßstand für den mit Rasen bewachsenen Boden an eine andere Stelle verlegt.

Für die Tiefen 0,5 bis 2,5 m sind die Erdbodenthermometer an den unteren Enden von Holzstangen angebracht, die in eisernen Schutzröhren stecken.

7. **Sonnenstrahlungsintensität.** Die Messung der Sonnenintensität wird mit einem Aktinometer nach Michelson-Marten durchgeführt. Für Vergleichsmessungen wird das Angströmsche Kompensationspyrheliometer Nr. 143 benutzt. Die Intensität wird in cal cm⁻² min⁻¹ angegeben. Gemessen werden die Gesamtstrahlung und die Strahlung hinter dem Rotfilter RG 2 und dem Gelbfilter OG 1, beides Potsdamer Standard. Soweit es möglich war, ist stets zur vollen Stunde wahrer Ortszeit gemessen worden. Mußte ausnahmsweise zu anderen Zeiten gemessen werden, so wurden, wenn es sich nur um geringe zeitliche Abweichungen handelte und keine Bedenken dagegen sprachen, die Werte zur vollen Stunde wahrer Ortszeit durch Interpolation bestimmt.

8. Luftelektrische Messungen. Das luftelektrische Potentialgefälle wird mit Benndorf-Elektrometern in zwei verschiedenen Empfindlichkeitsbereichen und einem im Freien aufgestellten Radiothorkollektor gemessen. Veröffentlicht werden Stundenmittel in Volt/m. Der Reduktionsfaktor ist zu 1,0 angenommen worden.

Die luftelektrische Leitfähigkeit wurde nach der Scheringschen Methode gemessen. In einem Drahtkäfig von 17 m Länge und 1 m² Querschnitt ist ein Draht ausgespannt, der durch Uhrwerk und Relais abwechselnd alle 10 Minuten auf + 300 bzw. — 300 Volt aufgeladen wird. Aus den Kurven der Entladungsgeschwindigkeit, die von einem Benndorf-Elektrometer aufgezeichnet werden, wird unter Berücksichtigung des Isolationsfehlers für jede volle Stunde mittlerer Ortszeit die positive und negative elektrische Leitfähigkeit der Luft berechnet. Die Angabe der Werte erfolgt in elektrostatischem Maß in 10⁹ sec⁻¹.

9. Abkühlungsgröße. Zur Bestimmung der Abkühlungsgröße wird ein Davoser Frigorimeter benutzt, dessen Kupferkugel auf der Instrumentenwiese in 2,5 m über dem Erdboden in der Nähe der Thermometerhütte aufgestellt ist. Daneben befindet sich in gleicher Höhe ein Kontaktanemometer. Die Aufzeichnung der Stundenmittel der Abkühlungsgröße erfolgte mit einem Registriergerät nach H. Lettau. Als Maß der Abkühlungsgröße sind cal cm² sec⁻¹ zugrunde gelegt.

10. Koordinaten des Observatoriums

Geographische Breite: $\varphi = 51^{\circ}7'N$

Geographische Länge: $\lambda = 13^{\circ}41'E$

Nähere Erläuterungen zum Tabelleninhalt und zu den internationalen Zeichen sind aus Teil I des Deutschen Meteorologischen Jahrbuchs ersichtlich.

Registrierungen

1

H_b = 260 m C_g = + 0.37 mm bei 738 mm

Luftdruck

700 mm + ...
