Zusammenfassung

Gemäß Resolution 12 der 14. Sitzung (Mai/Juni 1962) des Exekutiv-Ausschusses der Weltorganisation für Meteorologie werden in dem vorliegenden Tabellenband Werte der Strahlung und Sonnenscheindauer der Stationen Hamburg, Würzburg, München und Hohenpeißenberg veröffentlicht. Hierbei handelt es sich um Registrierergebnisse aus den Zeiträumen Juni 1957 bis Dezember 1958 (Internationales Geophysikalisches Jahr) und Januar bis Dezember 1959 (Internationale Geophysikalische Zusammenarbeit). Die Tages- und Monatssummen der Globalstrahlung und der Sonnenscheindauer erscheinen ab 1960 für die jetzigen Stationen des Strahlungsmeßgrundnetzes Hamburg, Braunschweig, Würzburg und Hohenpeißenberg laufend in den vom Deutschen Wetterdienst herausgegebenen Deutschen Meteorologischen Jahrbüchern.

Abstract

In accordance with Resolution 12 adopted at the 14th Session (May/June 1962) of the Executive Committee of the World Meteorological Organization, data of radiation and duration of sunshine obtained at the stations Hamburg, Würzburg, München and Hohenpeißenberg are published in this tabular compilation. It contains the observational data from the periods June 1957 to December 1958 (International Geophysical Year) and January to December 1959 (International Geophysical Cooperation). The daily and monthly sums of total radiation and the duration of sunshine have continuously appeared since 1960 in the "Deutsche Meteorologische Jahrbücher" (German Meteorological Year-Books), published by the Deutscher Wetterdienst, for the present stations of the basic network for radiation measurements, i. e., Hamburg, Braunschweig, Würzburg and Hohenpeißenberg.

Vorwort

Die Stationen, deren Registrierergebnisse die folgenden Tabellen enthalten, wurden so ausgewählt, daß gemäß den für das Internationale Geophysikalische Jahr herausgegebenen Richtlinien verschiedene Höhen und unterschiedliche örtliche Gegebenheiten erfaßt werden. Daher liegen Werte vor für den küstennahen Raum, für den Mittelgebirgsbereich und für das Alpenvorland mit einer Station auf der oberbayerischen Hochebene und einer Bergstation. Um ein Bild der lokalen Verhältnisse der vier Stationen zu geben, wird eine kurze Lagebeschreibung vorangestellt; hierbei wird neben den geographischen Koordinaten die Höhe des Solarimeters über NN angegeben.

Das Meteorologische Observatorium Hamburg (53°38′N, 10°00′E, 22 m) liegt im Norden der Stadt an der nördlichen Begrenzung der etwa 4 km² großen Rasenfläche des Flughafens Fuhlsbüttel. Eine stark aufgelockerte Stadtrandsiedlung schließt sich nördlich des Stationsgeländes an.

Die Agrarmeteorologische Versuchs- und Beratungsstelle Würzburg (49°48′N, 09°54′E, 263 m) befindet sich am westlichen Ende des muschelförmig von Südosten über Norden nach Südwesten gekrümmten, als gute Weinlage bekannten Bergrückens „Stein" im Nordwesten der Stadt Würzburg. Das ebene Meßgelände fällt nach drei Seiten steil zum Main ab. Nach Nordosten geht der Bergrücken in eine Hochfläche über.

Die Aerologische Station München (48°08′N, 11°42′E, 528 m) gehört zu dem Gelände des Flughafens München-Riem, der etwa 5 km vom östlichen Stadtrand Münchens entfernt und auf der sanft von Südsüdwesten nach Nordnordosten abfallenden Münchener Schotterebene gelegen ist.

Das Meteorologische Observatorium Hohenpeißenberg (47°48′N, 11°01′E, 1005 m) befindet sich auf dem westlichen Ende des Hohenpeißenberggipfels (989 m NN), der mit 20 km Abstand vom Alpenrand die am weitesten in die Bayerische Hochebene vorgeschobene Erhebung ist. Er liegt, fast genau in ost-westlicher Richtung verlaufend, in der Ammer-Moränenlandschaft zwischen Schongau und Weilheim und fällt nach Süden, Westen und Norden steil (etwa 200 m), nach Osten allmählich ab.

Die Strahlungswerte beruhen auf den Registrierungen des Solarimeters Moll-Gorczynski, das nach den bisher gemachten Erfahrungen gute quantitative Meßergebnisse liefert, die Sonnenscheindauer wurde mit dem im klimatologischen Beobachtungsnetz des Deutschen Wetterdienstes eingesetzten Sonnenscheinautographen Campbell-Stokes ermittelt. Die Meteorologischen Observatorien Hamburg und Hohenpeißenberg lieferten zusätzlich zu den Werten der Globalstrahlung noch Tages- und Monatssummen der Sonnen- und Himmelsstrahlung. Sämtliche Registrierergebnisse der Solarimeter wurden vom Meteorologischen Observatorium Hamburg geprüft. Von der Veröffentlichung der Relativbeträge der Strahlung und Sonnenscheindauer mußte abgesehen werden, da sich sonst der Umfang des Tabellenbandes verdoppelt hätte.

Leider ließen sich einzelne Lücken nicht vermeiden, die durch Solarimeterausfall bedingt waren, wobei es sich teils um technische Störungen, teils um Blitzeinwirkung handelte. Bei derartigen Ausfällen des Solarimeters sind in den Tabellen die entsprechenden Stundensummen der Sonnenscheindauer fortgelassen worden, da diese im Rahmen der vorliegenden Veröffentlichung in erster Linie dem Vergleich mit den Strahlungsmeßergebnissen dienen sollen. Die Hamburger Reihe ist vollständig; bei Würzburg fehlen September 1957 bis Februar 1958, Mai bis Juli 1958 sowie Mai und Juni 1959; in München wurden die Registrierungen erst

im Laufe des August 1957 aufgenommen; auf dem Hohenpeißenberg fielen die Registrierungen der Himmelsstrahlung — also die Werte der Sonnen- und Himmelsstrahlung — im Mai und Juni 1959 aus.

Die Manuskripttabellen wurden unter Leitung von Prof. Dr. R. Schulze (Meteorologisches Observatorium Hamburg), Dr. J. Grunow (Meteorologisches Observatorium Hohenpeißenberg), Prof. Dr. H. G. Müller (Aerologische Station München) und Dr. R. Weise (Agrarmeteorologische Versuchs- und Beratungsstelle Würzburg) aufgestellt. Die weitere redaktionelle Bearbeitung lag bei der Klimaabteilung des Zentralamtes in Händen von Dr. K. Keil und Dr. A. Schulze.

Erläuterungen zu den Tabellen

Die erste Tabellengruppe enthält Tagessummen für die einzelnen Monate. In ihnen sind die Strahlungsbeträge in ganzen cal/cm² und die Sonnenscheindauer auf Zehntelstunden genau angegeben.

Die zweite Tabellengruppe bringt die Stundensummen für die einzelnen Tage, wobei die Strahlungswerte auf halbe Kalorien genau angegeben sind. Dadurch sind die geringen Unterschiede zwischen dieser und den anderen Tabellengruppen zu erklären, die mitunter bei den durch Summierung gewonnenen Werten auftreten. Die Abkürzungen in den Sonnenscheindauertabellen haben folgende Bedeutung:

SA = Sonnenaufgang, SU = Sonnenuntergang, SA bis SU = Zeitspanne von Sonnenaufgang bis Sonnenuntergang auf Zehntelstunden genau.

In der dritten Tabellengruppe stehen die Monatssummen für die einzelnen Stunden. Hier sind — wie bei der ersten Tabellengruppe — die Strahlungsbeträge in ganzen cal/cm² und die Sonnenscheindauer auf Zehntelstunden genau angegeben.

Zu den Eintragungen ist im einzelnen noch zu bemerken: Die Zeiten sind in Wahrer Ortszeit (WOZ) angegeben, ein Punkt bedeutet, daß keine Strahlung bzw. kein Sonnenschein registriert wurde, eine Null besagt, daß der Strahlungsbetrag unter 0.5 cal/cm² bzw. die Sonnenscheindauer unter einer Zehntelstunde lag, eine Klammer kennzeichnet unsichere (z. B. interpolierte) Werte, ein waagerechter Strich ist dann gesetzt, wenn die Registrierung ausgefallen ist.

Tages- und Monatssummen der Globalstrahlung in cal/cm²
