Beobachtungen des Observatoriums Potsdam

Berlin 1936

Julius Springer

Inhaltsverzeichnis

Einleitung

Mit der vorliegenden Veröffentlichung der Beobachtungen und Registrierungen am Meteorologischen Observatorium des Reichsamts für Wetterdienst in Potsdam werden die im Deutschen Meteorologischen Jahrbuch 1934, Teil IV, Heft 1, veröffentlichten „Beobachtungen des Observatoriums Potsdam" fortgesetzt. Inhalt und Umfang sind gegen die Vorjahre wenig verändert.

Die Beobachtungstermine sind 7^h, 14^h und 21^h Ortszeit. Die Gesamtsummen des Niederschlages und der Verdunstung werden um 8^h, die Temperaturextreme um 21^h für die vorhergehenden 24 Stunden bestimmt und dem Datum des Meßtages zugeschrieben. Die Regen- und Schneemessungen werden auf der Beobachtungswiese, letztere auf einem Zementfeld, durchgeführt; die Schneehöhen sind Mittelwerte aus mehreren Messungen. Die Bewölkungsmengen werden 2-stündlich zur vollen Stunde mittlerer Ortszeit geschätzt.

Von den hier veröffentlichten Registrierungen beziehen sich Luftdruck, Lufttemperatur und Luftfeuchtigkeit auf die Angaben zur vollen Stunde. Die Berechnung der Tagesmittel dieser Elemente erfolgte nach der Formel:

$$(\tfrac{1}{2}0^h + 1^h + \ldots\ldots\ldots\ldots + 23^h + \tfrac{1}{2}24^h) : 24$$

Die Werte für Windrichtung, Windgeschwindigkeit und luftelektrisches Potentialgefälle sind Stundenmittel, diejenigen für Niederschlag, Sonnenscheindauer und Wärmesummen der Sonnenstrahlung Stundensummen. Alle Regiestrierungen sind, soweit nichts anderes vermerkt ist, nach mittlerer Ortszeit ausgewertet worden.

Zur Erläuterung der Registrierungen und Beobachtungen dienen die nachstehenden Hinweise:

1. Luftdruck. Die Werte sind dem Sprungschen Waagebarographen entnommen und werden durch Vergleichsbeobachtungen täglich einmal auf das Gefäßheberbarometer Wild-Fueß Nr. 248 reduziert.

2. Lufttemperatur und Luftfeuchtigkeit. Die Meßgeräte sind auf der Beobachtungswiese in der großen englischen Hütte, 2,2 m über dem Erdboden, aufgestellt. Die Terminwerte der Temperatur und Feuchtigkeit sind Ablesungen an einer Thermometeraufstellung nach August mit einem Aspirator für das feuchte Thermometer. Alle Feuchteangaben sind auf das aspirierte Psychrometer reduziert. Die unter den Terminbeobachtungen veröffentlichten Tagesmittel der Lufttemperatur werden nach der Formel $(7^h + 14^h + 2 \times 21^h) : 4$, die des Luftdrucks und der Dampfspannung aus dem arithmetischen Mittel berechnet. Als Registriergeräte dienten ein Richardscher Thermograph mit 8-tägigem Umlauf und ein Richardscher Hygrograph mit 1tägigem Umlauf.

3. Windmessung. Windrichtung und -geschwindigkeit werden mit einem mechanischen Schalenkreuz-Anemograph auf dem Turm des Observatoriums in 41.0 m Höhe über dem Erdboden registriert.

4. Niederschlags- und Verdunstungsmessung. Regenmenge und -dauer werden mit einer Sprung-Fueßschen Registrierwaage für Niederschlag und Verdunstung gemessen. Ferner ist noch ein mechanisch registrierender Regenmesser, System Hellmann-Fueß, mit 200 cm^2 Auffangfläche auf der Beobachtungswiese aufgestellt. Der Verdunstungsmessung dient ebenfalls noch ein Wildsches Evaporimeter mit 200 cm^2 Verdunstungsfläche, das in einer englischen Hütte auf der Beobachtungswiese beschattet, regensicher und windgeschützt aufgestellt ist.

5. Sonnenscheindauer. Die Aufzeichnung der Sonnenscheindauer erfolgt mit einem Sonnenscheinautographen Campbell-Stokes und mit einem Autographen nach Jordan (Zelloidinpapier), die auf dem Turm des Observatoriums in 34 m Höhe über dem Erdboden aufgestellt sind.

6. Erdbodentemperatur. Das Meßfeld befindet sich auf der Beobachtungswiese in kiesigem, humusfreiem Sand, dessen Oberfläche von Pflanzenwuchs und im Winter von Schnee frei gehalten wird. Für die Tiefen von 0,5 bis 12 m sind die Thermometer am unteren Ende von Holzstangen angebracht, die in Schutzröhren von Neusilber gesteckt werden.

7. Sonnenstrahlungsintensität: Die Messung der Sonnenintensität wird mit einem Bimetall-Lamellen-Aktinometer nach Michelson-Marten durchgeführt. Für Vergleichsmessungen wird das Angströmsche Kompensationspyrheliometer und das Silverdisk-Aktinometer S I XII benutzt. Die Angaben sind auf die Smithsonian-Skala 1913 reduziert und die „Luftmassen" auf den zur Zeit der Beobachtungen herrschenden Barometerstand umgerechnet. Die mitgeteilten Wärmesummen sind nach den Aufzeichnungen eines thermoelektrischen Pyrheliographen, System Moll-Gorczynski, berechnet; die Summenbildung ist durch planimetrische Auswertung nach den Registrierungen eines Schlagbügelgalvanometers von Hartmann und Braun vorgenommen worden.

8. Luftelektrische Messungen. Auf der Beobachtungswiese wird das luftelektrische Potentialgefälle mit Benndorf-Elektrometern in 2 verschiedenen Empfindlichkeitsbereichen und Poloniumkollektor gemessen. Eine weitere Meßeinrichtung, jedoch mit Radiothorkollektor, befindet sich auf dem Turm des Observatoriums. Die veröffentlichten Werte sind auf die freie Ebene reduziert.

Nähere Erklärungen zum Tabelleninhalt und zu den internationalen Zeichen sind aus dem Teil I des Deutschen Meteorologischen Jahrbuchs ersichtlich.
