Beobachtungen des Observatoriums Aachen

Berlin 1936

Julius Springer

Inhaltsverzeichnis

Die Terminbeobachtungen des Observatoriums Aachen sind im Deutschen Meteorologischen Jahrbuch, Teil I, abgedruckt.

Einleitung

Mit der vorliegenden Veröffentlichung der Beobachtungen und Registrierungen am Meteorologischen Observatorium des Reichsamtes für Wetterdienst in Aachen werden die im Deutschen Meteorologischen Jahrbuch 1934, Teil IV, Heft 3, veröffentlichten „Beobachtungen des Observatoriums Aachen" fortgesetzt. Inhalt und Umfang sind gegen das Vorjahr wenig verändert. — Die Terminbeobachtungen sind im Teil I des Deutschen Meteorologischen Jahrbuchs abgedruckt.

Von den hier abgedruckten Registrierungen beziehen sich Luftdruck und Lufttemperatur auf die Angaben zur vollen Stunde. Die Berechnung der Tagesmittel dieser Elemente erfolgte nach der Formel:

$$(\tfrac{1}{2}\,0^h + 1^h + \ldots\ldots + 23^h + \tfrac{1}{2}\,24^h) : 24$$

Die Werte für Windgeschwindigkeit sind Stundenmittel, die der Niederschlagsmengen Stundensummen; Niederschlagsdauer und Sonnenscheindauer sind in Stunden angegeben. Alle Registrierungen sind, soweit nichts anderes vermerkt ist, nach mittlerer Ortzeit ausgewertet worden.

Zur Erläuterung der Registrierungen und Beobachtungen dienen die nachstehenden Hinweise:

1. Luftdruck. Die Werte sind einem Richardschen Wochenbarographen entnommen und werden durch Vergleichsbeobachtungen auf ein Fueßsches Gefäßbarometer reduziert.

2. Lufttemperatur. Der Fueßsche Tagesthermograph steht auf der Wiese in einer englischen Hütte in 2,1 m Höhe über dem Erdboden. Die Werte werden durch dreistündigen Vergleich mit einem Normalthermometer kontrolliert.

3. Windmessung. Windrichtung und -geschwindigkeit werden mit einem Fueßschen Schalenkreuz-Anemographen auf dem Turm des Observatoriums in 27,0 m Höhe über dem Erdboden registriert.

4. Niederschlagsmessung. Als Meßgerät wird ein auf der Wiese aufgestellter registrierender Regenmesser nach Hellmann benutzt, dessen Auffangfläche von 200 cm^2 sich 1 m über dem Erdboden befindet.

5. Sonnenscheindauer. Die Aufzeichnung der Sonnenscheindauer erfolgt mit einem Sonnenscheinautographen Campbell-Stokes, der auf dem Turm des Observatoriums in 22,5 m Höhe über dem Erdboden aufgestellt ist.

6. Sonnenstrahlungsintensität. Die Messung der Sonnenintensität wird mit einem Bimetall-Lamellen-Aktinometer nach Michelson-Marten auf der Plattform des Observatoriums (214 m über N. N.) durchgeführt. Für Vergleichsmessungen wird das Angströmsche Kompensationspyrheliometer benutzt. Die Intensitätsmessungen in 3 Spektralbereichen sind in cal cm^{-2} min^{-1} auf wahre Ortszeit bezogen. Die Angaben sind auf die Smithsonian-Skala 1913 reduziert.

Nähere Erklärungen zum Tabelleninhalt und zu den internationalen Zeichen sind aus dem Teil I des Deutschen Meteorologischen Jahrbuchs ersichtlich.

Registrierungen

H_b = 204.8 m C_g = +0.30 mm bei 753 mm

Wetterkundliche Beobachtungen auf deutschen Feuerschiffen der Nord- und Ostsee

Einleitung

Schon frühzeitig erkannte man, daß die vor der Küste verankerten Feuerschiffe sehr wichtige und sehr geeignete Punkte für regelmäßige meeres- und wetterkundliche Beobachtungen sind. Bereits 1872 richtete daher die Preußische Kommission zur Erforschung der deutschen Meere einen regelmäßigen Beobachtungsdienst ein, und zwar auf den Feuerschiffen „Borkum" und „Außenjade", 1875 auch auf dem Feuerschiff „Weser". Die Beobachtungen, die regelmäßig veröffentlicht wurden, hörten jedoch mit dem Jahrgang 1893 auf.

Nach dem Kriege richtete die Deutsche Seewarte nach und nach auf 12 Nordsee- und 2 Ostsee-Feuerschiffen einen regelmäßigen Beobachtungsdienst ein. Die Veröffentlichung der Beobachtungsergebnisse war allerdings wegen der Inflations- und Deflations-Jahre zunächst nicht möglich. Erst 1928 konnte ein Teil der meereskundlichen Beobachtungen gedruckt werden, nämlich die Jahrgänge 1924 und 1925, in der zu diesem Zweck von der Seewarte gegründeten Veröffentlichung „Meereskundliche Beobachtungen auf deutschen Feuerschiffen der Nord- und Ostsee". Als weitere Hefte sind inzwischen erschienen: 1929 die Beobachtungsjahrgänge 1926 und 1927, dann 1930 – 1936 in je einem Heft die Beobachtungsjahrgänge 1928—1935, außerdem 1932 in einem Ergänzungsheft die Beobachtungsjahrgänge 1924—1928 der Feuerschiffe „Weser", „Bremen" und „Elbe 4" sowie die Tiefenbeobachtungsjahrgänge 1924—1929 vom Feuerschiff „Fehmarnbelt".

Nachstehende Tabelle zählt die deutschen Feuerschiffe auf, die sich 1935 an den meeres- und wetterkundlichen Beobachtungen beteiligt haben und gibt gleichzeitig ihre wichtigsten Daten. Zwei Kartenskizzen zeigen die Lage der Feuerschiffe in der Nord- und Ostsee.
