Registrierungen	I
Luftdruck	1
Lufttemperatur	7
Dampfdruck	13
Relative Feuchtigkeit	19
Sonnenscheindauer	25
Niederschlag	30
Windrichtung und -geschwindigkeit	34
Abkühlungsgröße	46
Sonstige Beobachtungen	52
Bodentemperaturen	52
Intensität der Sonnenstrahlung	64
Luftelektrisches Potentialgefälle	69
Luftelektrische Leitfähigkeit	75
Jahresmittel von Luftdruck, Temperatur, Dampfdruck, Relativer Feuchtigkeit, Windgeschwindigkeit, Abkühlungsgröße, Sonnenscheindauer, Luftelektrischem Potentialgefälle und Leitfähigkeit, Bodentemperatur	87
Zusammenstellung von Monats- und Jahreswerten	87
Wind (Häufigkeit der 16 Richtungen, Windwege für die einzelnen Richtungen)	87
Niederschlag (Monatliche Niederschlagsmenge für jede Stunde, Gesamtdauer des Niederschlags in Stunden, Häufigkeit der einzelnen Niederschläge nach Stunden- werten der Menge, Häufigkeit der einzelnen Nieder- schläge nach Stufenwerten der Dauer)	88
Absolute Extreme	89

Einleitung

Mit der vorliegenden Veröffentlichung der Beobachtungen und Registrierungen am Meteorologischen Observatorium des Reichsamtes für Wetterdienst in Wahnsdorf werden die im Meteorologischen Jahrbuch 1936, Teil IV, Heft 2, veröffentlichten „Beobachtungen des Observatoriums Wahnsdorf“ fortgesetzt. Inhalt und Umfang sind gegen das Vorjahr etwas erweitert. Neu hinzugekommen sind die Tabellen der Erdbodentemperaturen in mit Rasen bedecktem Boden.

Die Terminbeobachtungen sind im Teil I des Jahrbuches abgedruckt.

Von den hier veröffentlichten Registrierungen beziehen sich Luftdruck, Lufttemperatur, Luftfeuchtigkeit und elektrische Leitfähigkeit der Luft auf die Angaben zur vollen Stunde. Die Berechnung der Tagesmittel dieser Elemente erfolgte nach der Formel

$$(1^h + 2^h + \dots + 23^h + 24^h) : 24$$

Die Werte für Windrichtung, Windgeschwindigkeit, Abkühlungsgröße und lufterlektrisches Potentialgefälle sind Stundenmittel. Alle Registrierungen sind, soweit nichts anderes vermerkt ist, nach mittlerer Ortszeit ausgewertet worden. Unsichere und interpolierte Werte sind kursiv gedruckt.

Zur Erläuterung der Registrierungen und Beobachtungen dienen die nachstehenden Hinweise:

1. **Luftdruck.** Die Stundenwerte des Luftdruckes sind dem Fueßschen Aneroidbarographen Nr. 124479 mit Tagesumlauf entnommen und werden durch Vergleichsbeobachtungen (täglich 5mal) auf das Fueßsche Stationsbarometer Nr. 2294 reduziert.

2. **Lufttemperatur und Luftfeuchtigkeit.** Die Meßgeräte sind auf der Beobachtungswiese in einer Schreiberschen Hütte 2,5 m über dem Erdboden aufgestellt. Die Terminwerte von Temperatur und Feuchte werden mit einer Thermometeraufstellung bestimmt, deren feuchtes Thermometer seit 1936 mit künstlicher Ventilation versehen ist. Alle Feuchteangaben sind auf das aspirierte Psychrometer reduziert. An Registriergeräten waren vorhanden: 1 Fueßscher Thermograph und 1 Lambrechtscher Hygrograph mit Tagesumlauf und 1 Fueßscher Thermograph und 1 Fueßscher Hygrograph mit Wochenumlauf.

3. **Windmessung.** — Windrichtung und Windgeschwindigkeit sind den Aufzeichnungen des Fueßschen Universalapparates Nr. 28255 entnommen. Der Apparat ist auf dem Turm des Observatoriums aufgestellt, sein Schalenkreuz befindet sich 25 m über dem Erdboden.

Die Registrierung der Windgeschwindigkeit in 2,5 m über dem Erdboden erfolgt mit einem Fueßschen Kontaktanemometer, das auf der Instrumentenwiese aufgestellt und an einen Fueßschen Chronographen angeschlossen ist.

Die Vergleichsmessungen zwischen dem Fueßschen Universalapparat und dem früher in Wahnsdorf ausschließlich benutzten Schreiberschen Windmeßgerät sind zum Abschluß gelangt. Sie ergaben, daß der Schreibersche Apparat durchweg zu hohe Werte geliefert hat. Daher müssen alle in Wahnsdorf von 1916 bis 14. November 1936 gemessenen Windgeschwindigkeiten nach Maßgabe der unten stehenden Tabelle reduziert werden. Legt man als Normalwerte die vom Böenschreiber des Fueßschen Universalapparates aufgezeichneten Windgeschwindigkeiten zu Grunde — die daraus berechneten Stundenmittel der Windgeschwindigkeit sind als besonders gesichert anzusehen — so ergeben sich für das Schreibersche Windmeßgerät folgende Fehlanzeigen in Abhängigkeit von der Windgeschwindigkeit:

Stundenmittel der Windgeschwindigkeit nach Fueß-Universal	2	4	6	8	10	12	14 m/sec,
Mehranzeige des Schreiberschen Windmessers	27	13	12	11	8	6	4 Proz.

4. **Niederschlagsmessungen.** Zur Bestimmung des Niederschlags dient ein Hellmannscher Regenmesser mit 200 qcm Auffangfläche und ein heizbarer, registrierender Regenmesser nach Hellmann, Bauart Fueß. Die Vergleichsmessungen mit dem Schreiberschen Regenmesser, der 500 qcm Auffangfläche besitzt und der gegenüber dem Hellmannschen Regenmesser eine Mehranzeige von etwa 10 % aufweist, werden fortgesetzt.

Es ist versucht worden, die Niederschlagszeiten so genau wie möglich festzulegen. Zu diesem Zwecke wurden die Angaben des registrierenden Regenmessers, die bei schwachen Niederschlägen nicht mehr brauchbar sind, noch ergänzt durch Augenbeobachtungen und vor allem durch die Aufzeichnungen der lufterlektrischen Leitfähigkeit, da in diesen Registrierungen selbst sehr schwache Niederschläge deutlich hervortreten.

5. **Sonnenscheindauer.** Die Aufzeichnung der Sonnenscheindauer erfolgt mit einem Sonnenscheinauto-graphen nach Campbell/Stokes.

6. **Erdbodentemperaturen.** Die Bestimmung der Erdbodentemperaturen erfolgt auf 2 Meßständen auf der Instrumentenwiese. Der eine Meßstand befindet sich in lehmigem Kies, trägt an der Oberfläche eine Sandschicht und wird von Pflanzenwuchs völlig freigehalten. Der andere Meßstand ist mit kurz gehaltenem Rasen bedeckt. Auf beiden Meßständen wird im Winter eine etwa vorhandene Schneedecke nicht entfernt. — Für die Tiefen von 0,5—2,5 m sind die Erdbodenthermometer an dem unteren Ende von Holzstangen angebracht, die in eisernen Schutzhöhren stecken.

7. Sonnenstrahlungsintensität. Die Messung der Sonnenintensität wird mit einem Aktinometer nach Michelson-Marten durchgeführt. Für Vergleichsmessungen wird das Angströmsche Kompensationspyrheliometer Nr. 143 benutzt. Gemessen werden die Gesamtstrahlung und die Strahlung hinter dem Rotfilter RG 2 und dem Gelbfilter OG 1, beides Potsdamer Standard. An den mit Filtern ausgeführten Messungen sind keine Korrekturen angebracht. Die Angabe der Intensitäten erfolgt in $\text{cal cm}^{-2} \text{min}^{-1}$. Soweit es irgend möglich war, ist stets zur vollen Stunde wahrer Ortszeit gemessen worden. Mußte ausnahmsweise zu anderen Zeiten gemessen werden, so erfolgte, wenn es sich nur um geringe zeitliche Abweichungen handelte und keine anderen Bedenken dagegen sprachen, eine Reduktion der Intensitätswerte auf die volle Stunde wahrer Ortszeit.

8. Luftpotelektrische Messungen. Das luftpotelektrische Potentialgefälle wird mit Benndorf-Elektrometern in zwei verschiedenen Empfindlichkeitsbereichen und einem im Freien aufgestellten Radiothorkollektor gemessen. Veröffentlicht werden Stundenmittel in Volt/m. Der Reduktionsfaktor, dessen Einzelwerte zwischen 0,8 und 1,2 schwanken, ist zu 1,0 angenommen worden.

Die luftpotelektrische Leitfähigkeit wird nach der Scheringschen Methode gemessen. In einem Drahtkäfig von 17 m Länge und 1 m² Querschnitt ist ein Draht ausgespannt, der durch Uhrwerk und Relais in einem Wechsel von 10 Minuten entweder auf + 300 oder auf - 300 Volt aufgeladen wird. Aus den Kurven der Entladungsgeschwindigkeit, die von einem Benndorf-Elektrometer aufgezeichnet werden, wird unter Berücksichtigung des Isolationsfehlers für jede volle Stunde die positive und negative elektrische Leitfähigkeit der Luft berechnet. Die Angabe der Werte erfolgt in elektrostatischem Maß in 10^{-9} sec^{-1} .

9. Abkühlungsgröße. Zur Bestimmung der Abkühlungsgröße wird ein Davoser Frigorimeter benutzt, dessen Kupferkugel auf der Instrumentenwiese in 2,5 m Höhe über dem Erdboden in der Nähe der Thermometerhütte aufgestellt ist. Daneben befindet sich in gleicher Höhe ein Fießches Kontaktanemometer. Die Aufzeichnung der Stundenmittel der Abkühlungsgröße erfolgte bis 18. September 1937 mit einem Registriergerät eigener Bauweise, wobei zur Kontrolle der Registrierungen an der Frigorimeteruhr täglich 4—5 Augenablesungen vorgenommen wurden. Vom 19. September 1937 an wird die Abkühlungsgröße mit einem Registriergerät nach H. Lettau aufgeschrieben. Gemessen wird die Abkühlungsgröße in $\text{mcal cm}^{-2} \text{sec}^{-1}$.

10. Koordinaten des Observatoriums

Geographische Breite: $\varphi = 51^{\circ} 7' \text{ N}$

Geographische Länge: $\lambda = 13^{\circ} 41' \text{ E}$

Höhe des Geländes über Normal-Null: $H = 246 \text{ m}$

Nähere Erklärungen zum Tabelleninhalt und zu den internationalen Zeichen sind aus dem Teil I des Deutschen Meteorologischen Jahrbuchs ersichtlich.

Luftelektrisches Potentialgefälle

Wahnsdorf, 1937

In Volt pro Meter
Normaltage sind halbfett, unsichere Werte kursiv gedruckt
